Presented on behalf of the KISS Study Team
Questions for the U.S. Concerning Sustained Observations

• Apart from weather, what are our national priorities for sustained Earth observations?

• What paradigm will the U.S. use as the basis for setting these national priorities?

• What organization or body will be chartered to develop these priorities for the U.S.?

• What is our national approach to implementing sustained Earth observations that meet these priorities, including the information production and delivery services?
There is growing urgency for improved public and commercial services to support a resilient, secure, and thriving U.S. population and economy, particularly in the face of mounting decision-support needs for environmental stewardship and hazard response, and for climate change adaptation and mitigation actions.

~$150B annually in the U.S. alone
As with weather, significant science and societal benefits have been demonstrated from other long-record, satellite observations of the Earth.*

Many quantities measurable from satellites that have been shown to have scientific and/or decision-support value do not have a plan for sustained observations.*

*Examples include: precipitation, soil moisture, streamflow, snowpack, greenhouse gas concentrations and emissions, stratospheric ozone, radiation budget, aerosol/cloud profiles, ocean salinity and surface winds.
The Keck Institute for Space Studies (KISS) was established at the Caltech in January 2008 with a $24 million grant over 8 years from the W. M. Keck Foundation.

The Institute is a "think and do tank," whose primary purpose is to bring together a broad spectrum of scientists and engineers for sustained technical interaction aimed at developing new space mission concepts and technology.

The Institute is centered on the intellectual, instrumentation, and research strengths of the Caltech Campus and JPL — and augments those strengths by inviting external experts from academia, government, and industry to engage in its programs.
Study Participants

1. Waleed Abdalati - University of Colorado Boulder
2. Nancy Baker - Naval Research Laboratory
3. Stacey Boland – Jet Propulsion Laboratory/Caltech/NASA
4. Michael Bonadonna - National Environmental Satellite, Data, and Information Service, NOAA
5. Carol Anne Clayson - Woods Hole Oceanographic Institution
6. Belay Demoz - University of Maryland, Baltimore County
7. Kelsey Foster – Stanford University
8. Christian Frankenbarg - Caltech
9. Maria Hakuba – Jet Propulsion Laboratory/Caltech/NASA
10. Therese Jorgensen - NASA Ames Research Center
11. Ryan Kramer - University of Maryland, Baltimore County/NASA Goddard Space Flight Center
13. Anna Michalak - Carnegie Institution for Science/Stanford University
14. Asal Naseri - Space Dynamics Laboratory
15. Pat Patterson - Space Dynamics Laboratory
16. Peter Pilewskie - University of Colorado Boulder
17. Steven Platnick - NASA Goddard Space Flight Center
18. Charlie Powell – University of Michigan / NOAA
19. Jeff Privette - NOAA’s National Centers for Environmental Information
20. Chris Ruf - University of Michigan
21. Tapio Schneider - Caltech
22. Jörg Schulz - European Organization for the Exploitation of Meteorological Satellites (EUMETSAT)
25. Qianqian Song – University of Maryland, Baltimore County
27. Timothy Stryker - USGS National Land Imaging Program
28. Wenying Su - NASA Langley Research Center
29. Mathew Van Den Heever – University of Colorado
30. Anna Veldman – UCLA
31. Duane Waliser – Jet Propulsion Laboratory/Caltech/NASA
32. Elizabeth Weatherhead - Jupiter Intelligence and University of Colorado Boulder

9 on or previously on CESAS and/or 2017 ESAS Decadal Survey
7 Early Career members
4 NASA Centers, 3 NOAA, 2 USGS, Navy, Universities, EUMETSAT, GCOS/CEOS, small sats, etc.
Selected for the 2022 KISS Study Program
Towards a U.S. Framework for Continuity of Satellite Observations of Earth’s Climate and for Supporting Societal Resilience

KISS Study Proposal
The goal of this study program is help accelerate discussions and plans for a greater and more impactful U.S. contribution to the global climate observing system. In this context, “climate” includes observations that support climate science and process understanding, as well as monitoring for situational awareness, climate services, impact response, adaptation, and mitigation assessments.

Aspiration: Aid/support the anticipated upcoming NASEM discussions regarding satellite-based climate observing system

Study Website
https://kiss.caltech.edu/programs.html#satellite_observations
Towards a U.S. Framework for Continuity of Satellite Observations of Earth’s Climate and for Supporting Societal Resilience

Three Supporting Mini-Symposia: POR, NGO, Climate Security (recorded, links available)
1. What to include?

**Observation Priorities** Consider approaches to identify and prioritize satellite observables that should be sustained to support Science and Decision Support

2. How to include?

**Architecture Approaches/Configurations:** Consider approaches to architecture design and development, including “new space” and technology advances, commercial data, and international considerations.

3. How to sustain & impact?

**Stewardship and Implementation:** Consider data flow infrastructure and operations, calibration & validation, uncertainty quantification and traceability, data stewardship best practices, dissemination.
Green Team – What to Include? How to Identify/Prioritize?

1. What to include?

Observation Priorities: Consider approaches to identify and prioritize satellite observables that should be sustained to support Science and Decision Support.

- Waleed Abdalati (U of Colorado/CIRES)
- Stacey Boland (JPL/Caltech/NASA)
- Carol Anne Clayson (WHOI)
- Kelsey Foster – Stanford University
- Christian Frankenberg (Caltech)
- Maria Hakuba – JPL/Caltech/NASA
- Anna Michalak (Stanford/CIS)
- Paul Selmants (USGS)
- Graeme Stephens (JPL/Caltech/NASA)
- Wenying Su - NASA Langley
- Mathew Van Den Heever (U. of Colorado)
- Anna Veldman (QMUL/UCLA/Columbia)
Start with Identifying and Prioritizing Sustained Observation Needs for the U.S.

Example Framework To Highlight Multi-Dimensional Considerations for Sustained Observation Priorities

12 Societal Benefit Areas (SBAs)
- Agriculture and Forestry
- Biodiversity
- Climate
- Disasters
- Ocean and Coastal Resources
- Energy and Mineral Resources
- Ecosystems
- Human Health
- Space Weather
- Transportation
- Water Resources
- Weather
Orange Team – How to include? Architecture options?

2) How to include?

Architecture Approaches/Configurations:
Consider approaches to architecture design and development, including “new space” and technology advances, commercial data, and international considerations.
Expanding Opportunities for Contributing to and Sustaining Earth Observations

Lower cost of access to space is increasing the sources able to contribute elements to the Earth observing system.

- traditional government agencies
- international partners
- commercial entities with data buys
- NGOs and non-profit
- hybrid solutions
Leveraging “NewSpace”, the Latest Technologies, Commercial and NGO Opportunities

Table 1. Summary of current and potential future acquisition & support models

<table>
<thead>
<tr>
<th>Approach</th>
<th>Description</th>
<th>Risk Owner</th>
<th>Data Distribution</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traditional</td>
<td>Government full specification of system, launch, operations, data processing and distribution. Typically, cost-plus contracts. Note that it is not uncommon for existing traditional project implementations to have foreign partner contributed elements to help achieve mutual objectives at a lower cost than a single country paying for the full mission.</td>
<td>Government</td>
<td>Government fully owns the data and is typically unrestricted</td>
<td>NOAA GOES, NPPS; NASA-USGS Landsat; NASA science missions</td>
</tr>
<tr>
<td>Complete System Contributed by Foreign Partner</td>
<td>A foreign government contributes a needed observing system, either as a single system, or as a long-term commitment of sustained observations for the given variable(s). This can relieve the need for other countries to make the same measurement, or at a minimum help meet some of the observing requirements and therefore likely reduce the overall cost to the U.S. if any residual / complementary observing systems are still needed.</td>
<td>Foreign Government (but other users depending on this contribution also suffer consequences if it fails)</td>
<td>Data is open.</td>
<td>Example partner contributions for NASA research missions include launches, instruments, spacecraft buses, and ground system elements.</td>
</tr>
<tr>
<td>Fixed price for service</td>
<td>Government specifies the data or service desired, not how they are delivered. Competes fixed price contracts for service delivery. Contractor is expected to invest some of its own resources and may be able to sell the same services to others once developed.</td>
<td>Shared between government and vendor</td>
<td>Data could be either open or restricted, depending on long term cost share.</td>
<td>No existing example for remote sensing. NASA commercial cargo and crew programs are similar examples in human exploration.</td>
</tr>
<tr>
<td>Data buy with upfront promise or down payment investment by government</td>
<td>Government invests money upfront in company model, potentially via competition, but long-term funding is expected to come from NGOs.</td>
<td>Shared between government and vendor</td>
<td>Typically, data is somewhat restricted, with the data vendor needing an opportunity to make additional money off data sales unless higher prices for the data are an option.</td>
<td>NASA example - SeaWIFS 1997-2007; Orbital Sidekick hyperspectral imaging constellation has In-Q-Tel and AFVentures’s Strategic Financing program investment funding.</td>
</tr>
<tr>
<td>Data buy – with no upfront promise by government</td>
<td>Government is not involved in system specification or operation. Government does not provide upfront investment or data buy guarantees. Government only buys data after it is available and makes it available to its user community.</td>
<td>NGO</td>
<td>Typically, data is restricted - each user generally must buy its own copy of the data; There may be future funding models where data is openly distributable after purchase, but at a higher price. The latter might be an option for data whose profit utility is low after long latency (e.g., old weather data).</td>
<td>NOAA Commercial Data Program; NASA Commercial Smallsat Data Acquisition (CSDA) program commercial data distribution models of Maxar, Planet, Capella, Ioffeye, and others, with substantial National Reconnaissance Office data buys.</td>
</tr>
<tr>
<td>Public/Private Partnership: Philanthropy-led partnership</td>
<td>Philanthropy pays for technology development and initial prototype spacecraft, arranges for technology transfer / licensing to production partner. Production partner deploys, operates, and maintains systems.</td>
<td>Philanthropy</td>
<td>Mix of open and restricted data. For Carbon Mapper the GHO (CO2 and CH4) data will be open access. Other hyperspectral data and products will be sold by Planet to fund the constellation.</td>
<td>Carbon Mapper - University of Arizona, Planet, NASA/JPL, mix of philanthropies and NGOs.</td>
</tr>
<tr>
<td>Non-profit funded system</td>
<td>NGO (typically a non-profit working with one or more philanthropies or other partners) fully funds the development of observing and data distribution system.</td>
<td>NGO &amp; funding partners</td>
<td>Data is open.</td>
<td>MethaneSat - Environmental Defense Fund, New Zealand Space Agency.</td>
</tr>
</tbody>
</table>
Blue Team – How to sustain and make needed impacts?

Stewardship and Implementation: Consider data flow infrastructure and operations, calibration & validation, uncertainty quantification and traceability, data stewardship best practices, dissemination.
A framework for successful stewardship of sustained Earth observations requires: **a)** end-to-end planning with a long-term horizon in mind, **b)** a suite of technical attributes and platforms that support open and easy access, **c)** interoperability of related observations, **d)** carefully coordinated and sustained programmatic structures that provide the needed shepherding and support, etc.
**Data Stewardship, Information Production, Dissemination & Use**

Table 4.1. Key elements of the data production value chain of satellite-based Earth observations.

<table>
<thead>
<tr>
<th>Data Production Elements</th>
<th>Critical Continuity Considerations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sensor Technology and Characteristics</td>
<td>• Representativeness of the sensor measurements (e.g., spectral channels, sampling, etc.)</td>
</tr>
<tr>
<td></td>
<td>• Known sensor characteristics and uncertainties</td>
</tr>
<tr>
<td>Satellite Observing System Architecture</td>
<td>• Time-of-day or viewing geometry impacts</td>
</tr>
<tr>

</table>

**Figure 4.2.** An example of the importance of climate observation continuity. The figure on the left shows incoming radiative energy from the Sun, a fundamental climate data record, from the set of space-based measurements since 1978. The measurements are shown at each instrument’s native calibration scale. Because the individual observation records overlap, it enables the construction of the composite record on the right where all measurements are on a common scale. This helps reveal trends in the long-term data record that may have impacts on climate. Figure from G. Kopp (https://spot.colorado.edu/~koppg/TSI/).
The U.S. could benefit from a systematic and overarching plan or framework for identifying, prioritizing, funding, and implementing sustained Earth observations that are critical for supporting our nation’s science, policy, and societal resilience goals.

A clear and unified approach to sustained Earth observations and determination of our national priorities for these observations may improve the effectiveness of the varied U.S. investments in Earth observations and associated information systems. Such an approach may also enable the United States to play a larger global leadership role in environmental stewardship, Earth system and climate science, and related public services.

Path Forward and Next Steps

- Formal KISS Study Completed in the Summer of 2023

- The team is organizing ‘Continuity’ sessions at AGU’22 and AMS’23.
2017 Recommendation 2.2: NASA—with NOAA and USGS participation—should engage in a formal planning effort with international partners (including, but not limited to ESA, EUMETSAT, and the European Union via its Copernicus Program) to agree on a set of measurements requiring long-term continuity and to develop collaborative plans for implementing the missions needed to satisfy those needs. This effort to institutionalize the sustained measurement record of required parameters should involve the scientific community, and build on and complement the existing domestic and international Program of Record.

2017 Recommendation 4.6: NASA ESD should employ the following guidelines for maintaining programmatic balance:
- New Measurements versus Data Continuity. Lead development of a more formal continuity decision process (as in NASEM, 2015) to determine which satellite measurements have the highest priority for continuation, then work with U.S. and international partners to develop an international strategy for obtaining and sharing those measurements.

2017 Recommendation 4.7: NASA should make the following scope changes to its program elements:
- Technology Program. Establish a mechanism for maturation of key technologies that reduce the cost of continuity measurements.

2007 Recommendation: The Office of Science and Technology Policy, in collaboration with the relevant agencies and in consultation with the scientific community, should develop and implement a plan for achieving and sustaining global Earth observations.
National Plan for Civil Earth Observations

3. Categories for Civil Earth Observations
   3.1. Overview of Categories
   3.2. Sustained Observations
      3.2.1. Sustained Observations for Public Services
      3.2.2. Sustained Observations for Earth System Research in the Public Interest
   3.3. Experimental Observations

4. Priorities and Supporting Actions for Civil Earth Observations
   4.1. Priorities
      4.1.1. Priority 1: Continuity of Sustained Observations for Public Services
      4.1.2. Priority 2: Continuity of Sustained Observations for Earth System Research
      4.1.3. Priority 3: Continued Investment in Experimental Observations
      4.1.4. Priority 4: Planned Improvements to Sustained Observation Networks and Surveys for All Observation Categories
      4.1.5. Priority 5: Continuity of, and Improvements to, a Rigorous Assessment and Prioritization Process

The purpose of the National Plan for Civil Earth Observation is to help coordinate Federally-supported Earth observations and investments, identify opportunities to advance Earth observations, and achieve national Earth observation policy objectives. This plan serves as a resource to assist Federal departments and agencies (hereafter, "agencies") in their planning, coordination, identifying high-leverage research and development opportunities, and avoiding unnecessary duplication and redundancy. This plan should help inform the normal budget process through which resources are allocated. Under the NSTC which has the responsibility to ensure R&D is coordinated across Federal departments and agencies, the USGEO Subcommittee will use this plan to coordinate implementation of the recommended actions.

RFI FOR REVIEW OF 2023 PLAN FORTHCOMING ~NOV, 2023

Goal 1: Support and Balance the Portfolio of Earth Observations
   - Prioritize the availability and continuity of Earth observations
   - Implement innovative Federal procurement and acquisition strategies
   - Strengthen research and capabilities that enhance usability
   - Provide long-term stewardship

Goal 2: Engage the Earth Observations Enterprise
   - Strengthen coordination within the Earth Observations Enterprise
   - Coordinate R&D of experimental technologies and techniques
   - Recognize and analyze program models for leveraging data as a strategic asset

Goal 3: Improve the Impact of Earth Observations
   - Articulate the value of Earth observations
   - Improve the Earth observation portfolio through introduction of new technologies, including learning and adaption
   - Promote and leverage international collaboration
   - Develop a skilled and capable workforce
Towards a **U.S. Framework for Continuity of Satellite Observations of Earth’s Climate and for Supporting Societal Resilience**

**Identifying Science and Application Priorities**

**Developing Architecture Options & Opportunities**

**Accounting for Long-term Programmatic and Technical Support**
Towards a U.S. Framework for Continuity of Satellite Observations of Earth’s Climate and for Supporting Societal Resilience

LIST OF STUDY FINDINGS – SECTION 1

1. Introduction
Finding 1.1 - There is growing urgency for improved public and commercial access to support resilient, secure, and efficient U.S. population and economy, particularly in the face of climate change, and for establishing a U.S. framework for continuity of satellite observations and for supporting societal resilience.

LIST OF STUDY FINDINGS – SECTION 2

2. Identifying Prioritizing Sustained Observation Needs
Finding 2.1 - Prioritization of variables requiring continuity of satellite observations is complex and may benefit from consideration across multiple societal sectors and services. The technical requirements and observation requirements (e.g., temporal and spatial sampling, accuracy, latency) may be highly dependent on the specific application sector and/or the underlying supporting science objectives.

LIST OF STUDY FINDINGS – SECTION 3

Finding 3.1 - The impact of the lower cost of access to data is that many new demands (e.g., NGOs such as Carbon Mapper and MethaneNet) and international efforts (i.e., countries that want to help address climate change now that they can afford it) are able to contribute elements to the Earth observing system. Future U.S. and international coordination mechanisms for earth observations could be designed to take advantage of these types of contributions.

LIST OF STUDY FINDINGS – SECTION 4

4. Data Stewardship and Information Production, Usability and Dissemination
Finding 4.1 - A framework for successful stewardship of sustained earth observations requires defined and ongoing policies for ensuring long-term access to societal-essential products (e.g., well beyond individual satellite mission lifetimes), a suite of technical attributes that support open and easy access, interoperability of related observations, and as well as coordinated and sustained programmatic structures that provide the needed stewardship and support.

LIST OF STUDY FINDINGS – SECTION 5

5. Summary and Path Forward
Finding 5.1 - The U.S. could benefit from a systemic and coordinated framework for identifying, prioritizing, funding, and implementing sustained earth observations that are critical for supporting our nation’s science, policy, and societal resilience goals.

KISS Study
13 Findings Across 5 Sections

KISS Continuity Study Team, Towards a U.S. Framework for Continuity of Satellite Observations of Earth’s Climate and for Supporting Societal Resilience, Earth’s Future, American Geophysical Union, (To be) Submitted with minor revisions 10/25/2023
Copernicus is the EU’s Earth observation program that looks “at our planet and its environment to benefit all European citizens. It offers information services that draw from satellite Earth Observation and in-situ data...to help service providers, public authorities, and other international organizations improve European citizens' quality of life and beyond.

The satellite component of Copernicus is based on a series of “Sentinel” missions which are developed to provide the observations needed to deliver the public benefits of the Copernicus Programme – which are provided in the form of Atmosphere, Marine, Land, Emergency, Climate, and Security Services.
1 Introduction

Finding 1.1 - There is growing urgency for improved public and commercial services to support a resilient, secure, and thriving U.S. population and economy, particularly in the face of mounting decision-support needs for environmental stewardship and hazard response, and for climate change adaptation and mitigation actions (e.g. FFAPCS, 2023).

Finding 1.2 - Space-based Earth observations represent an essential component of the infrastructure needed to support the delivery of critical environmental science and decision-support information with local, national, and global utility.

Finding 1.3 - Many quantities measurable from satellites that have been shown to have scientific and/or decision-support value do not have a plan for sustained observations.

Finding 1.4 - The U.S. does not have a systematic, overarching plan or framework for identifying, prioritizing, funding, and implementing additional sustained Earth observations to support our nation’s science, policy, and societal resilience goals.
Towards a U.S. Framework for Continuity of Satellite Observations of Earth’s Climate and for Supporting Societal Resilience

LIST OF STUDY FINDINGS – SECTION 2

2. Identifying and Prioritizing Sustained Observation Needs

Finding 2.1 - Prioritization of variables requiring continuity of satellite observations is complex and may benefit from consideration across multiple societal sectors and services. The technical requirements on these observations (e.g., temporal and spatial sampling, accuracy, latency) are highly dependent on the specific application sector and/or the underlying supporting science objectives.

Finding 2.2 - Any prioritization framework will: a) have subjective elements, b) be time and context dependent due to changing science and societal benefit needs, technological advances and programmatic opportunities, and c) will likely benefit from periodic reexamination.
LIST OF STUDY FINDINGS – SECTION 3

3 Satellite Observing Architectures: Technology, “NewSpace”, Commercial and NGO Considerations

Finding 3.1 One impact of the lower cost of access to space is that many new domestic (e.g., NGOs such as Carbon Mapper and MethaneSat) and international entities (e.g., countries that want to help address climate change that previously could not afford to) are able to contribute elements to the Earth observing system. Future U.S. and international coordination mechanisms for Earth observations could be designed to fully take advantage of these types of contributions.

Finding 3.2 Sources of new missions and observing capabilities to address unmet U.S. needs for continuity of Earth observations could be obtained from traditional government acquisition, international partners, commercial entities, NGOs, data purchases, and hybrid solutions (i.e. Table 1).

Towards a U.S. Framework for Continuity of Satellite Observations of Earth’s Climate and for Supporting Societal Resilience

LIST OF STUDY FINDINGS – SECTION 4

4 Data Stewardship and Information Production, Usability and Dissemination

Finding 4.1 - A framework for successful stewardship of sustained Earth observations requires end-to-end planning with a long-term horizon in mind (i.e., well beyond individual satellite mission lifetimes), a suite of technical attributes that support open and easy access, interoperability of related observations, as well as carefully coordinated and sustained programmatic structures that provide the needed shepherding and support.

Finding 4.2 - For climate datasets, the value to science and society accrues with longevity, so stewardship and the necessary technical and programmatic structures needed to support it, require an enduring commitment that should be independent of individual missions. Investing in data usability, traceability, provenance, and interoperability capabilities can greatly enhance the return on the given civil or commercial investments made to deploy the observing system (Figure 6).

Finding 4.3 – While strides have been made by individual U.S. agencies to provide more ready access to Earth observation datasets, full exploitation of the data and associated investments for U.S. civil and commercial interests and services suggests a more holistic stewardship approach providing the means for platforms where observations and models reside together in an easily accessible and manipulatable form and the latest analysis techniques, such as machine learning and artificial intelligence, can be applied to entire observational records.
5 Summary and Path Forward

Finding 5.1 The U.S. could benefit from a systematic and overarching plan or framework for identifying, prioritizing, funding, and implementing sustained Earth observations that are critical for supporting our nation’s science, policy, and societal resilience goals.

Finding 5.2 A clear and unified approach to sustained Earth observations and determination of our national priorities for these observations may improve the effectiveness of the varied U.S. investments in Earth observations and associated information systems. Such an approach may also enable the United States to play a larger global leadership role in environmental stewardship, Earth system and climate science, and related public services.
