

# What it Took to Get These Measurements: An Engineer's Perspective

## EPD: Energetic Particle Detector

Steve Jaskulek (EPD System Engineer)

# Energetic Particle Detector (EPD) Science Overview

**The main scientific goals of EPD were:**

- **Measure the energy and angular distribution, composition, and stability of trapped radiation at Jupiter.**
- **Study the interaction of these energetic particles with the Galilean satellites and the solar wind.**
- **Derive thermal plasma flow velocities and temperatures.**
- **Examine adiabatic and non-thermal processes in the trapped radiation.**

**EPD measured the detailed energy and angular distribution of the following over  $4\pi$ :**

- **Ions ( $Z \geq 1$ ) from 20 keV to 55 MeV**
- **Electrons from 15 keV to  $> 11$  MeV**
- **Ion composition from 10 keV/nuc to  $> 10$  MeV/nuc**

# EPD Overview

**Follow-on to APL's Voyager LECP instruments**

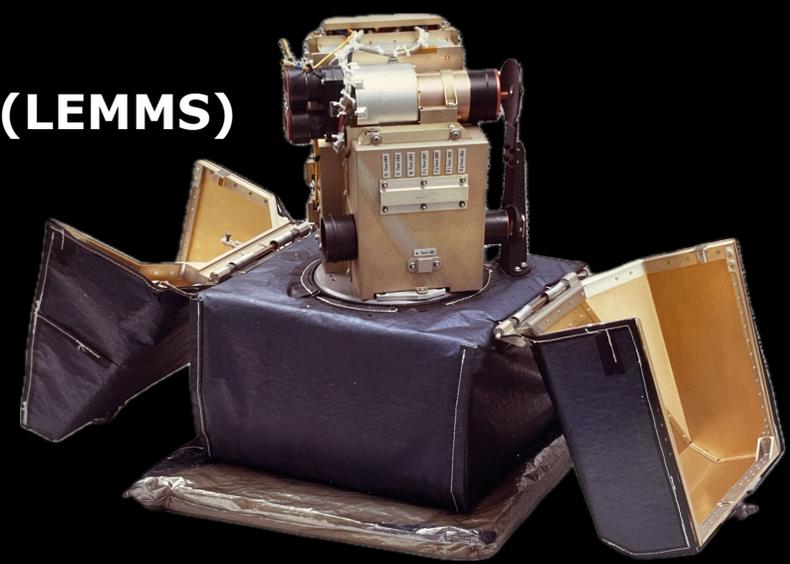

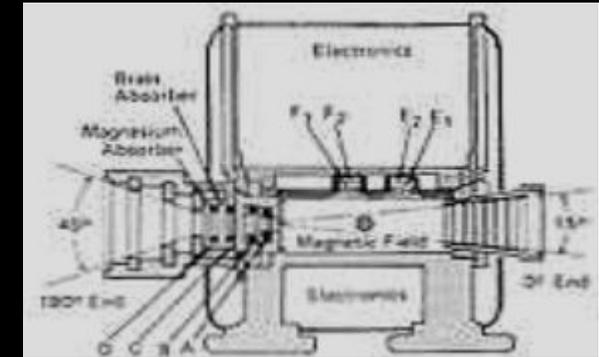

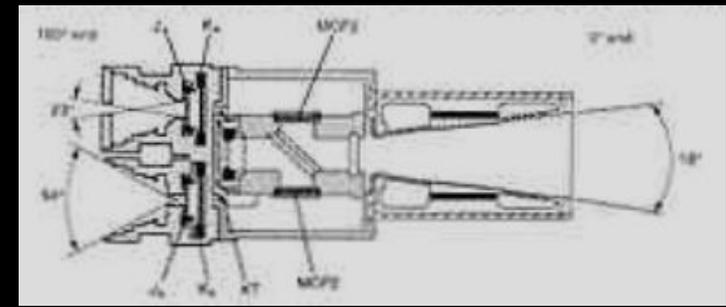

**The EPD weighed 10.5 kilograms and used 10.1 watts of power on average.**

**Our major partner was the Max Planck Institute for Solar System Research**

**There were two bi-directional sensors:**

- **Low-Energy Magnetospheric Measurements System (LEMMS)**
  - Stacked detectors and magnetic deflection
- **Composition Measurement System (CMS)**
  - Stacked detectors and time-of-flight

**First APL instrument with a microprocessor**

## Early Years

**“How did you became the EPD System Engineer.....?”**

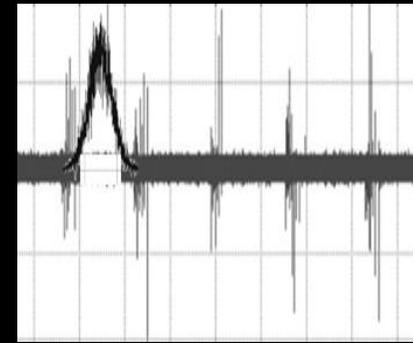

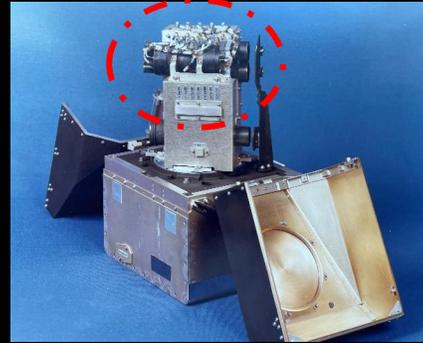

- **At APL for 6 months, much of that in a training program**
- **I was offered the opportunity to work on Galileo**
  - **But commit to 4.5 year mission assignment ????**
- **I was supposed to be the junior system engineer, and eventually transition take over, but....**
- **Thus began my trial by fire, where everything was new to me**
  - **Team was very experienced and very supportive**
  - **Particular nod to Don Williams (PI), Barry Tossman (PM), and Ray Thompson (Tech), and Dick McEntire (Co-I) - they set the bar**
- **Still, it was like drinking from a firehose**
- **Despite my EE degree, my real education was about to start...**

# My Education

## Electrical Problems

- **NOISE !!!!** - mV and nsec
  - Mentored by Bob Martin
  - Peeling back the layers of the onion
  - Oh yeah baby – touch me right there
    - *"Steve- If you don't figure out how to make the noise go away without your finger touching that circuit, you are going to end up with 9 fingers"*

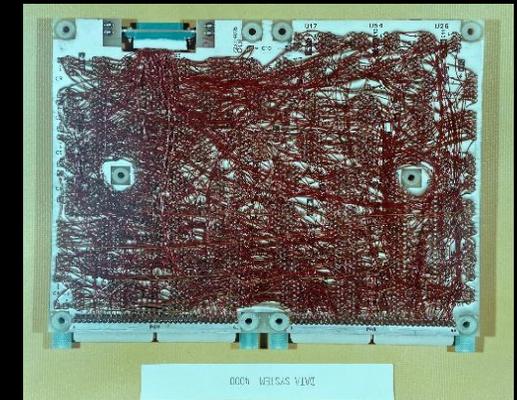

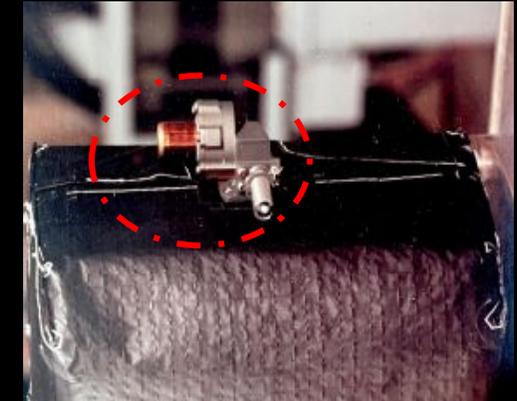

## Mechanical Problems –

- Cover release vibration failure
- AC-Delco car thermostats make great actuators

## Thermal Problems

- Why does data stop when we go cold???
- A blessing in disguise

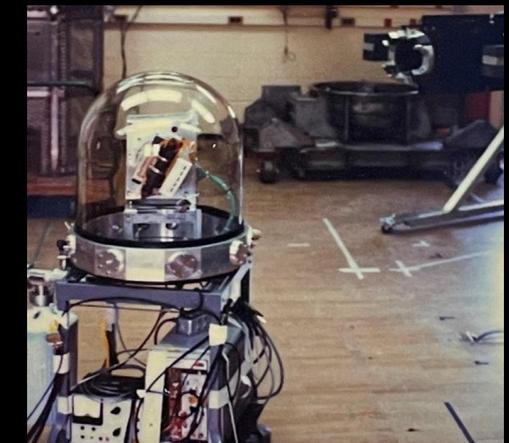

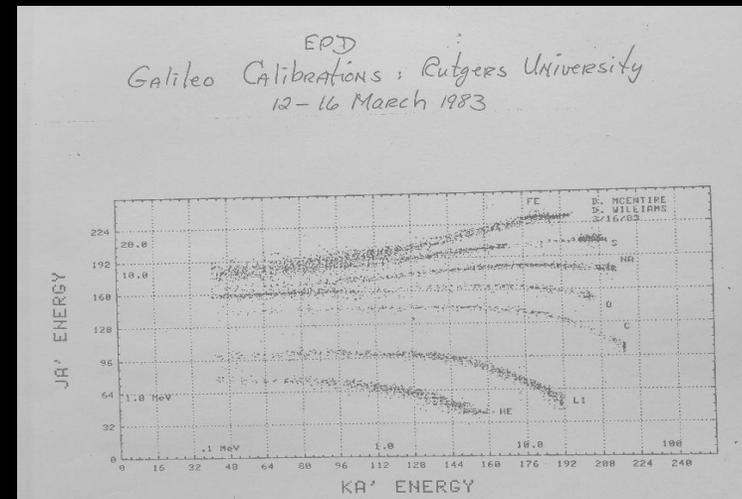

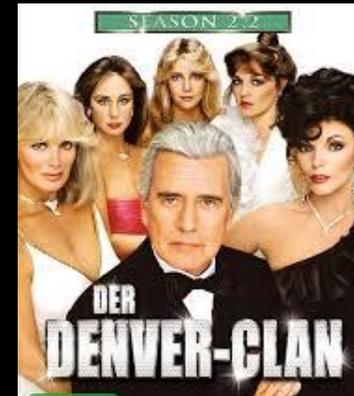

# My Education

## Calibration

- Many visits to the GSFC accelerators
- High energy runs at Rutgers
  - 24/7
- RTG test at Mound Ohio
- Many days at Max Planck
  - 9-5 (at first)
- There is nothing as rewarding as seeing real data from the assembled instrument !!

# The Hard Work is Done - Delivery

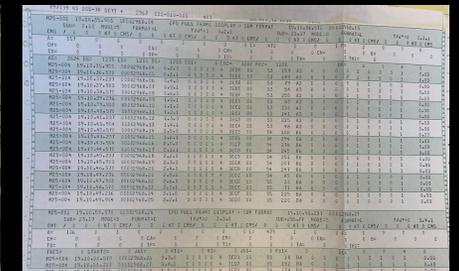

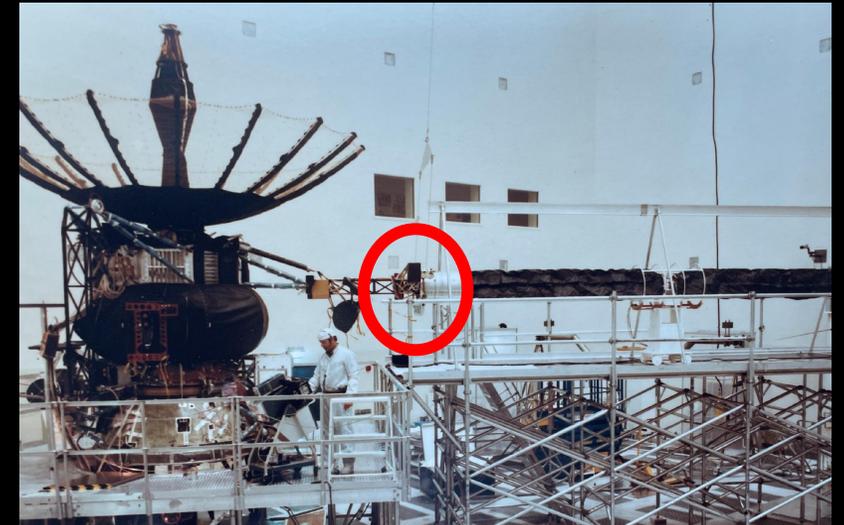

## It's the only way to fly..

- Hand carried on plane – 1<sup>st</sup> class seats 😊
- Mr. Box.... Mr. A Box
- Steve and Eydie Gorme are sitting in my seats!!

## Arrival at JPL

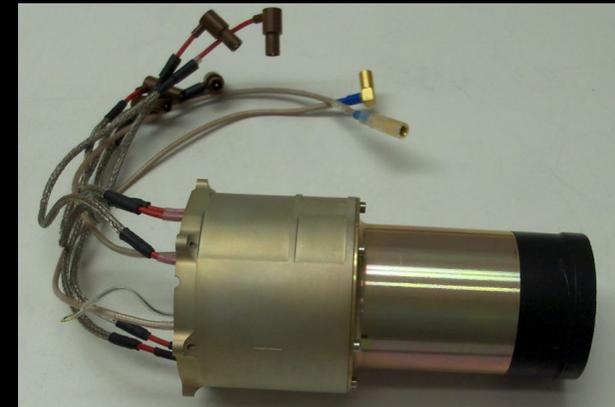

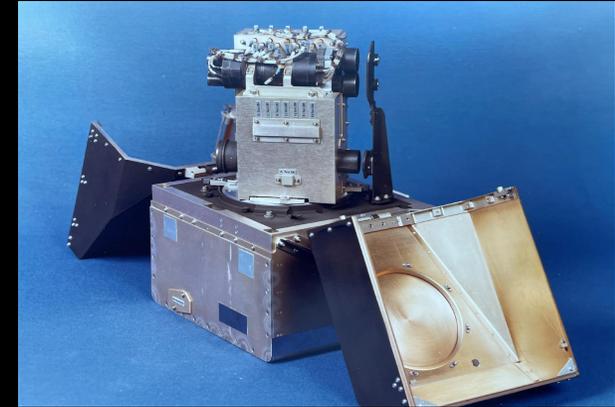

- All roads lead through Al Whittlesey's EMC area
  - Magnetic testing
- Great feeling to walk into S/C cleanroom and install our instrument
- Testing
  - No displays, just a large room full of giant, noisy line printers (3 trees/day)
- Spent so much time at JPL, local waiters would recognize my 'wife' and I at restaurants

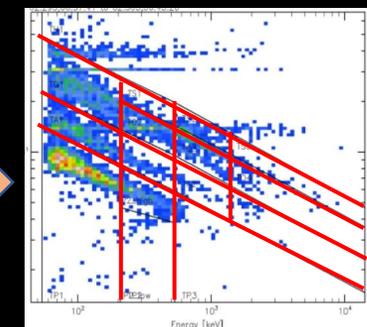

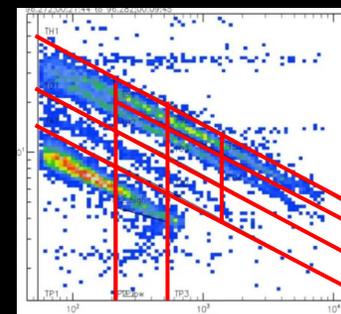

## But Wait – The Fun has Just Started

### Challenger #1: Challenger

- Given the delay, the Project asked if new technology was available
- We just had to swap out our existing  $\Delta E \times E$  head with a new TOF  $\times E$  head
  - By “just” - we needed to add in a high voltage supply, new sensor, new timing circuitry, mechanically fit it where the old hardware had been, and hide it all from the ROM-based software
- Incredible team effort
  - Max Plank designed and provided most of the new hardware (sensor, HVPS, TOF board)
  - APL modified main electronics, software
- This lowered low energy threshold for ion species determination from hundreds of keV to 20 keV

## More Fun

### Challenge #2: Late breaking news

- At the daily status meeting from the Cape, our PI, Don Williams said we needed to make a change to our instrument.
  - We had learned that energetic oxygen was going to degrade our thin silicon detectors much more than thought, leading to high leakage currents (-> noise + energy losses).
- Plan A or Plan B
  - I was tasked with installing the flux reducer
- Phone home
  - "I'm going up in the shuttle..."
- Found: mid Sept  
Fixed: Oct 3  
Launched: Oct 19

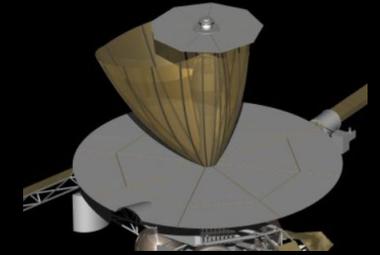

# My Favorite Shot

# Oy Vey – Now What Do We Do?

## Challenge #3: The Antenna

- **Reduce our telemetry rate by >50X - This seemed impossible.**
- **BUT - the majority of Voyager papers actually used ground-processed 15 minute spin-sectored averages.**
- **Our EPD telemetry was time based (4/3 seconds), producing 912 bps, and we needed to reduce to something more like 15 bps**
- **Needed two new software modes, even though we were still limited by the ROM code**
  - **Existing high rates during flybys**
  - **Spin-based collection summed to 15 minute averages for S-band**
- **A few “small” issues to work**
  - **Needed to synchronize our motor stepping to spacecraft spin**
    - **Our instrument had no idea where the spacecraft was pointing!**
  - **The EPD didn’t have enough memory to buffer this new 15-minutesectored data**

# Not So Fun

## Challenge #3 (cont):

- We had three things going for us:
  - DMA (direct memory access) interface between the spacecraft and EPD
  - ROM-based code was written to support patching
    - An extra 256 bytes of SRAM we installed in the EPD during the rework after Challenger.
    - Tal Brady and the CDS team at JPL
- We engineered a constant dance of data exchanges between the EPD and CDS memories that allowed us to synchronize our data collection and motor movement with the spacecraft spin and to pass our 4/3 second data buffers to the CDS for summing.
- This beautiful kludge was tested at JPL, along with cobbled-together EM hardware from all the other instrument teams.
- It worked!!
- This was one of most rewarding tasks I've worked in my career

	Address	Assem.	Hex	Opcodes

## What A Ride !

- **The EPD continued to work well throughout the mission.**
- **I supported the EPD through the end.**
  - **It was a great training ground to learn my craft**
- **I have since led work on Jupiter-bound particle instruments**
  - **Cassini, New Horizons, Juno, JUICE, plus Europa Clipper missions**
- **It is truly satisfying to know that in addition to the great science, the EPD measurements have helped define the Jovian radiation environment these missions would see**
- **I've enjoyed them all, but Galileo was my first love, and still holds a special place in my heart**
- **p.s. I still have the spacecraft simulator in my office, just in case we need to fire up the EM 😊**

# What a Team !

- **It's all about the people**
- **APL**
  - **J. Crawford, J. Dassoulas, D. Fort, S. Gary, J. Heiss, B. J. Hook, J. Kohl, H. Malcom, R.W. McEntire, R. Moore, T. Mueller, M. Puntz, S. Purwin, N. Rothman, P. Schwartz, R. Thompson, B. Tossman, J. Townsend, Jr., D.J. Williams, C. Wingate, and H. Wong**
- **Max Planck Institute fur Aeronomie**
  - **W. Boeker, E. Buble, W. Klemme, H. Sommer, W. Weiss, B. Wilken, and H. Wirbs**
- **NOAA Space Environment Laboratory and Bell Labs**
  - **J. Cessna, T. Fritz, R. Dayhoff, C. Holmes, L. Lanzerotti**
- **JPL** ★
  - **Tal Brady, W. Fawcett, R. Gibbs, G. McSmith, N. Murphy, R. Parrish, J. Taylor, J. Willett, and A. Whittlesey**
- **Others**
  - **T. Armstrong, S. Brown, J. Burke and R. Martin**
