Outline

I. Dwarf Galaxies and the Too Big to Fail Problem

2. Baryon Physics vs. Dark Matter Physics

- SIDM with $\sigma/m \sim (0.5-1)$ cm²/g can solve the problem
- Feedback probably can't solve it, environment an issue.

3. Baryons + SIDM = Harder than we hoped (but fun)

4. Future directions

Smallest Dwarfs: Great DM Laboratories

$$M_\star \sim 10^6 M_\odot$$

$$\frac{M_{\text{DM}}}{M_\star} \sim 50$$

$$r_\star \sim 500 \text{ pc}$$

Dark Matter Dominated => Easy to interpret

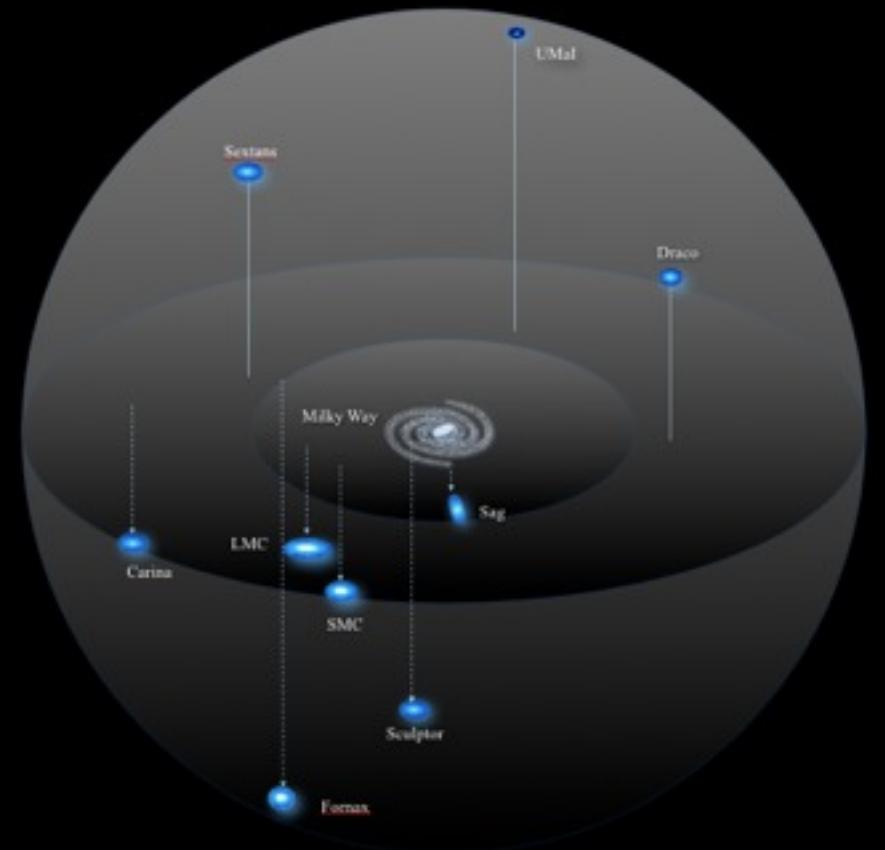

Very Few Stars => SN Can't Alter DM

Best-studied dwarfs are satellites of MW

Simulated MW Halo

Garrison-Kimmel, JSB, Boylan-Kolchin

Bright Satellites of the MW
 $L > 10^5 L_{\odot}$

Biggest subhalos = brightest satellites?

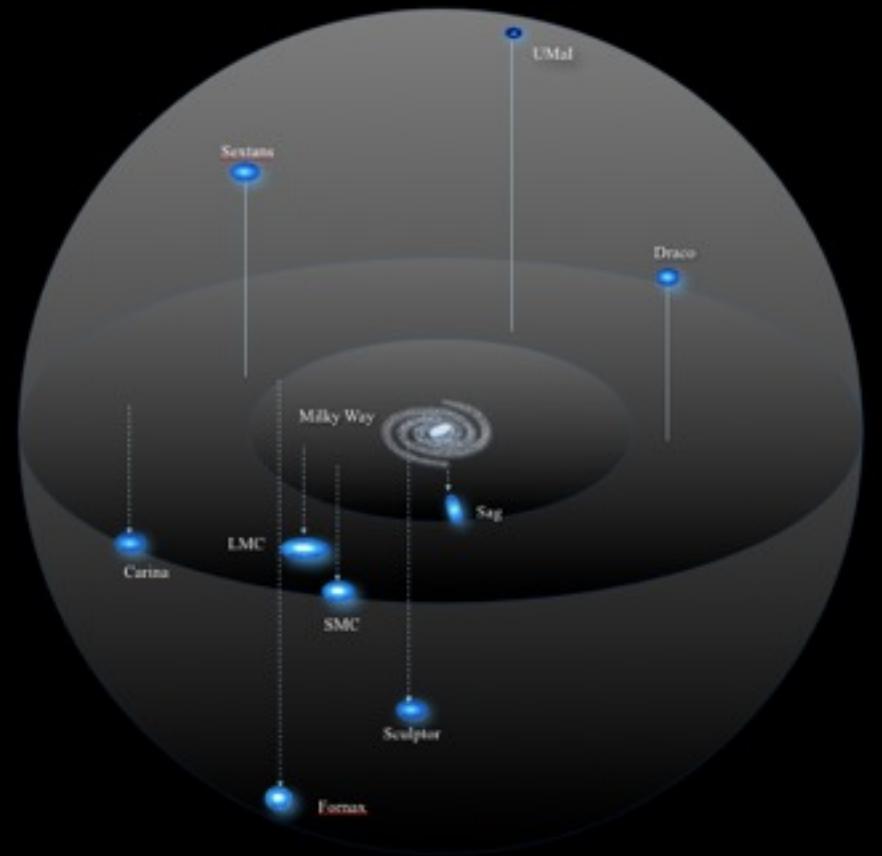

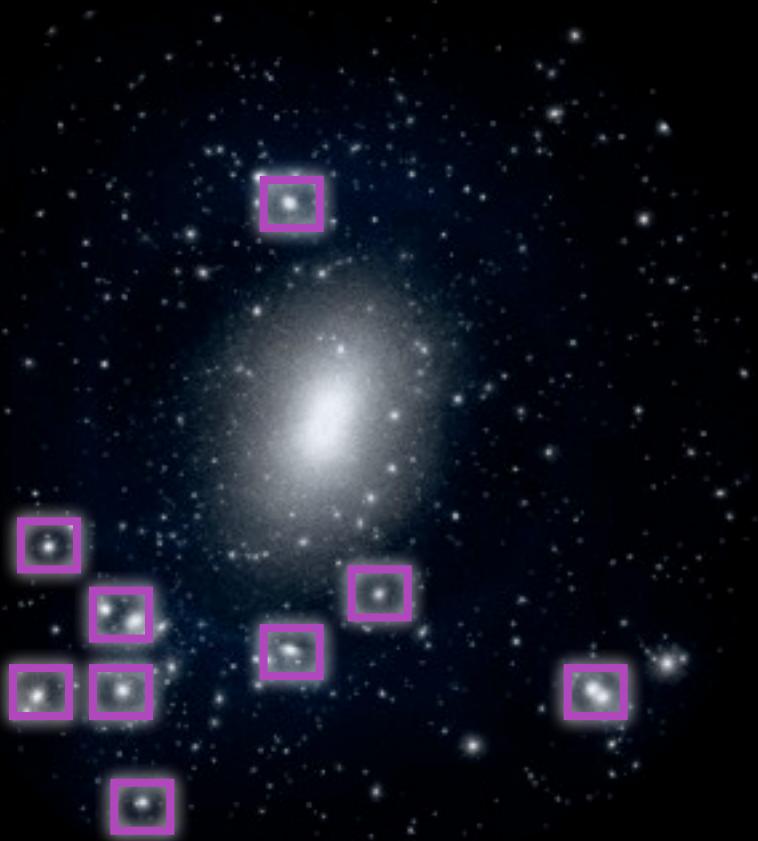

Image: Garrison-Kimmel

How do the masses compare?

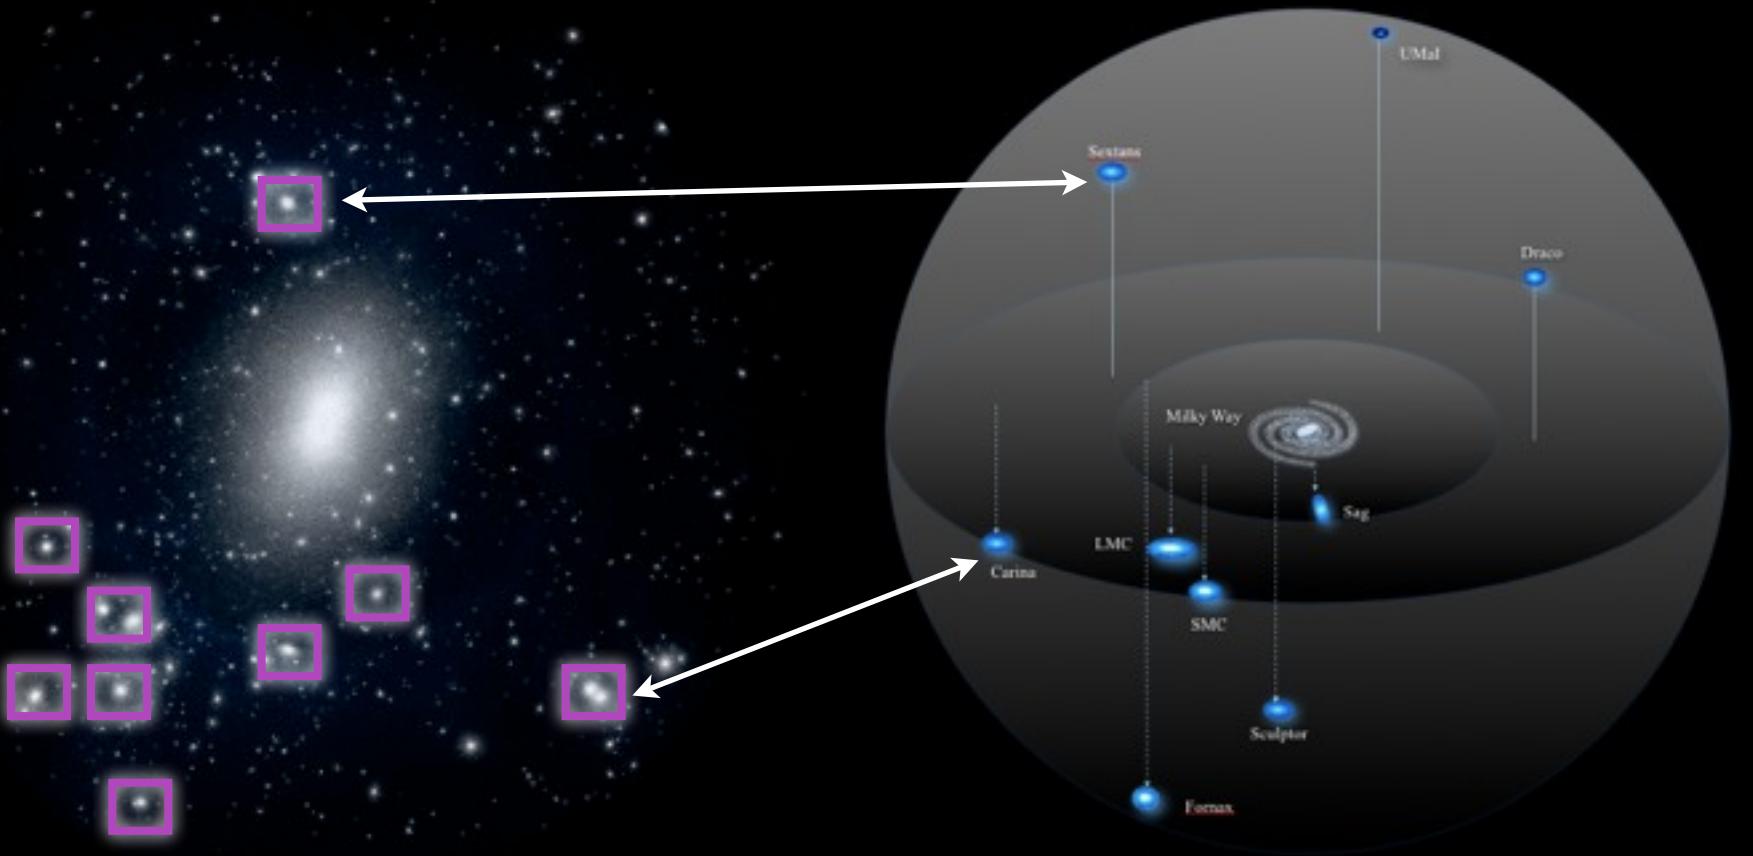

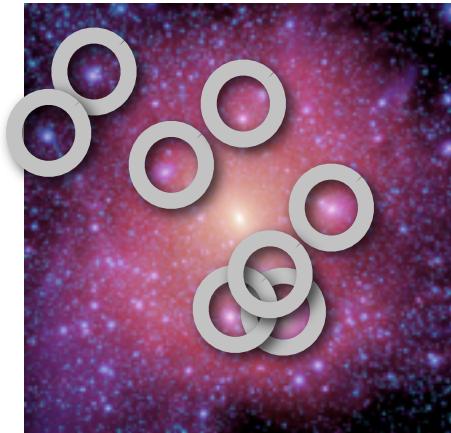

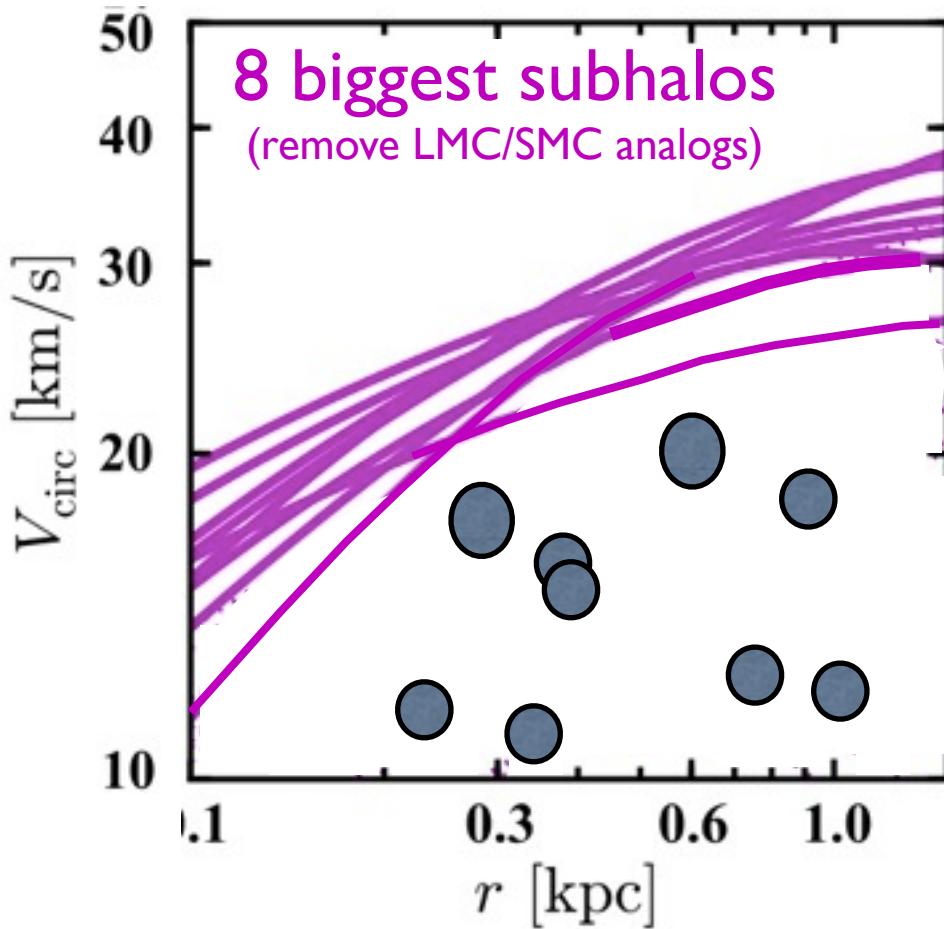

Image: Garrison-Kimmel

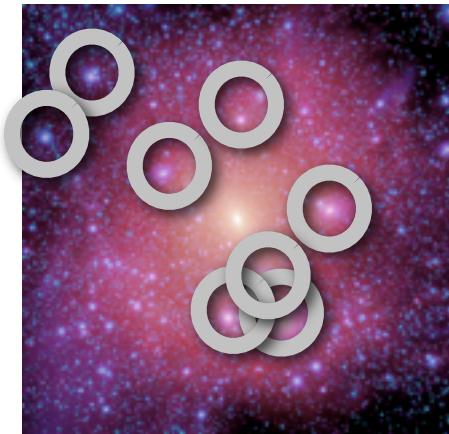

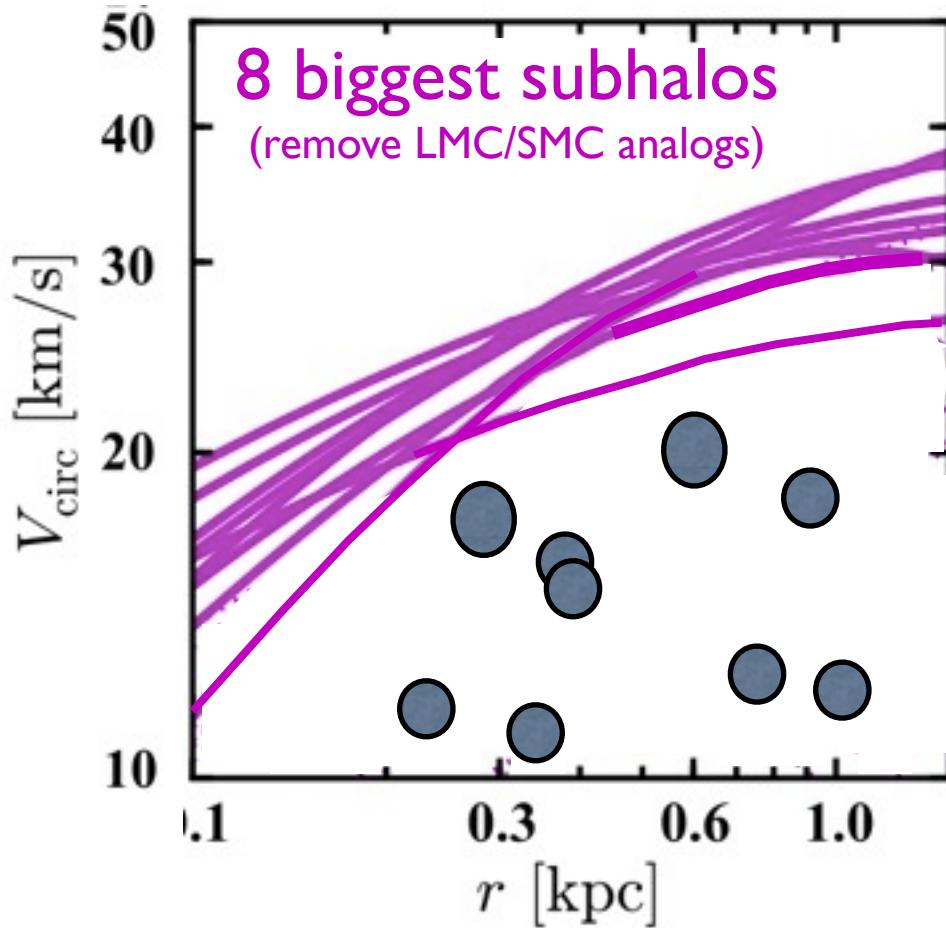

All bright MW dSphs ($L > 10^5 L_{\text{sun}}$)

8 biggest subhalos are
too dense to host ANY
of MW dSph satellites

Boylan-Kolchin, JSB, Kaplinghat 2011,2012

Too Big to Fail Problem

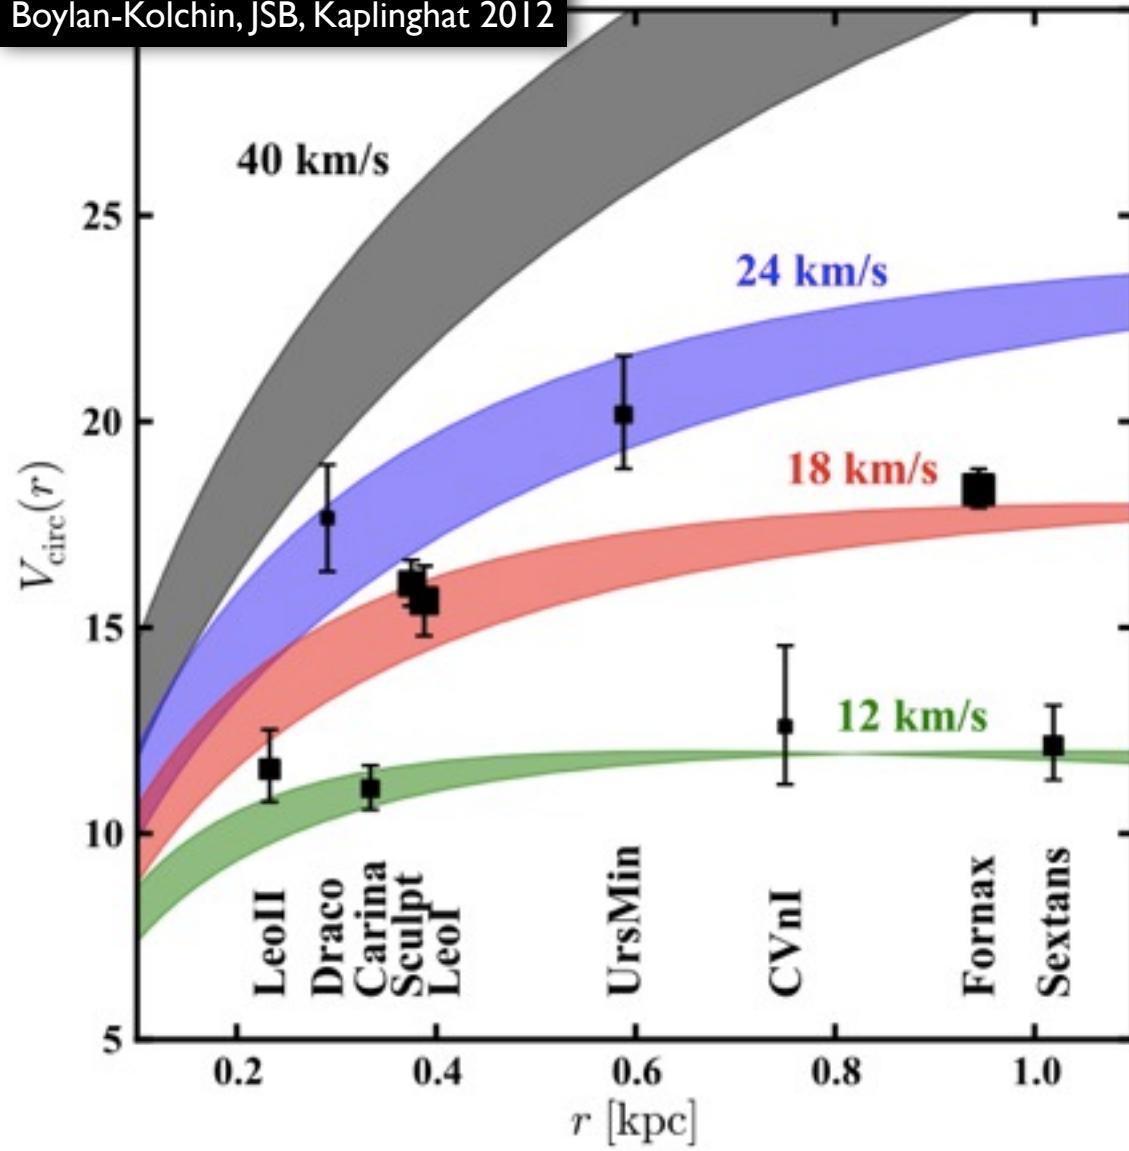

8 biggest subhalos are
too dense to host ANY
of MW dSph satellites

Boylan-Kolchin, JSB, Kaplinghat 2011,2012

Summary of the Too Big To Fail problem:

Boylan-Kolchin, JSB, Kaplinghat 2012

Expect 5-40 subhalos with $V_{\text{max}} > 25$ km/s

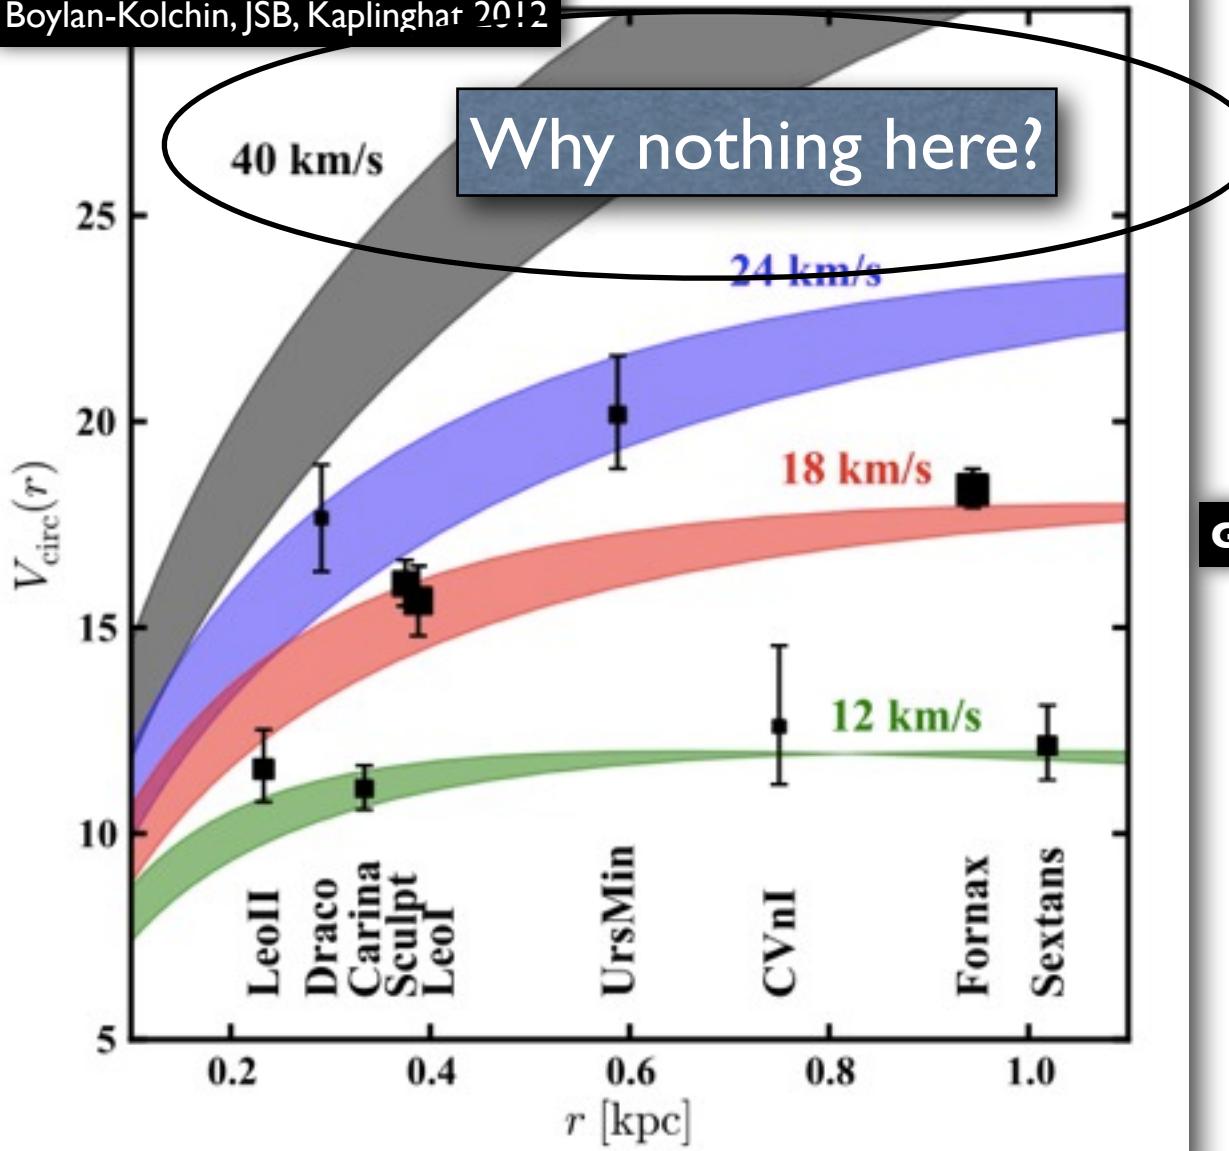

(from 48 simulations)

Garrison-Kimmel et al. in prep

J. Bullock, UC Irvine

Summary of the Too Big To Fail problem:

Boylan-Kolchin, JSB, Kaplinghat 2012

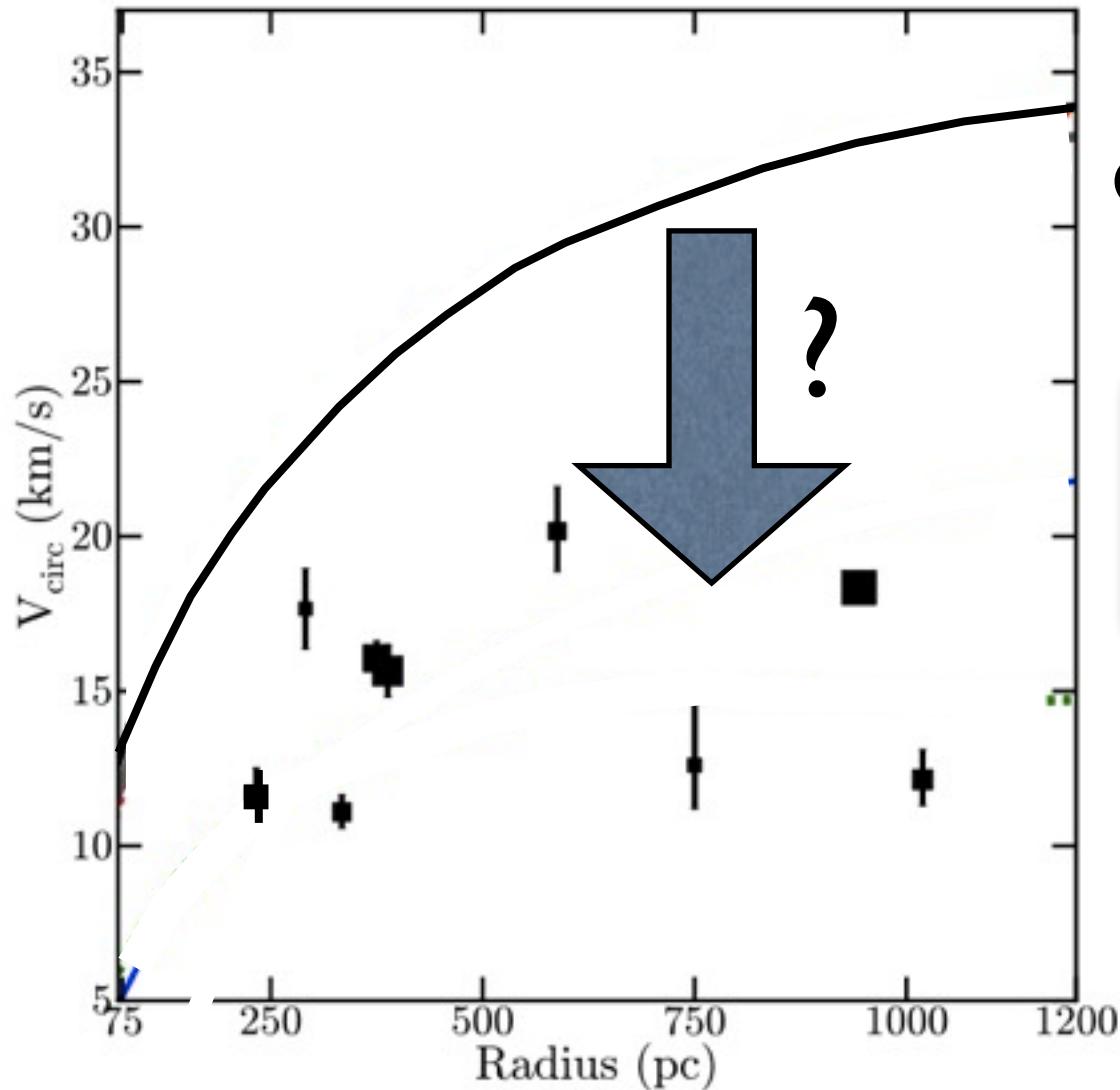

Expect 5-40 subhalos with $V_{\text{max}} > 25$ km/s

(from 48 simulations)

Garrison-Kimmel et al. in prep

What Can Baryons Do?

Consider a $M_* \sim 10^6 M_{\odot}$ dwarf galaxy

What does it take to remove enough DM?

Basic Energy Argument Against SN Feedback

$$M_\star \sim 10^6 M_\odot \leftrightarrow \Delta M_{\text{DM}} \sim 5 \times 10^7 M_\odot$$

Must remove \sim 50 times more dark matter than mass in stars!

Energy Required: $> 10^{55}$ ergs

Exceeds every supernovae that has gone off
coupled directly to the dark matter.

Penarrubia et al. 2012;
Garrison-Kimmel et al. 2013

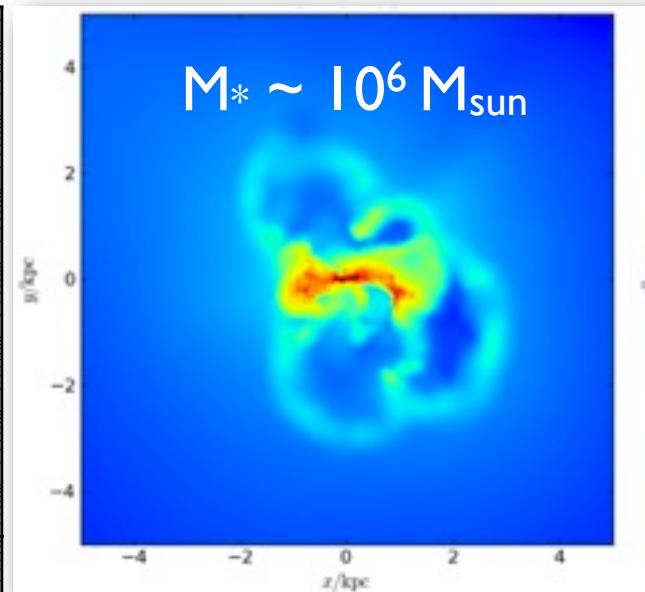

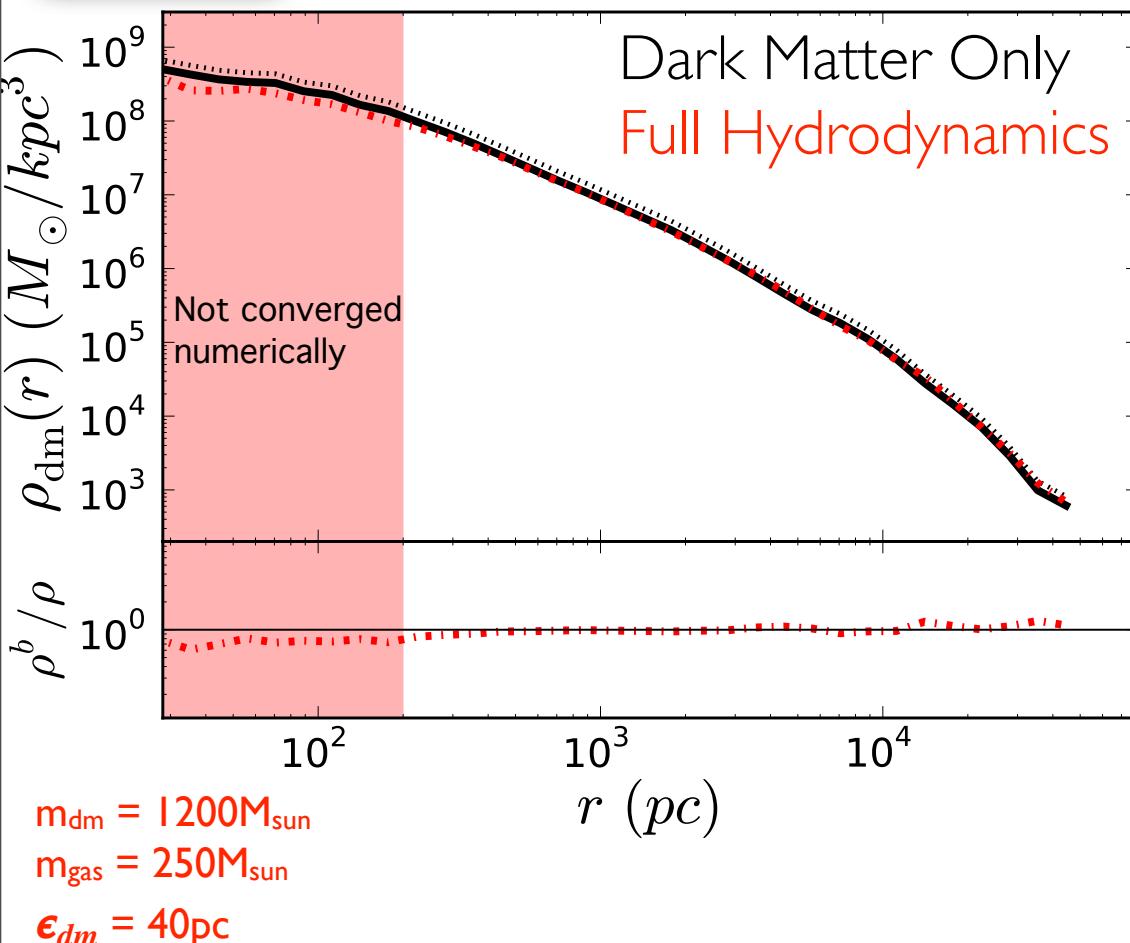

Oñorbe et al. (in prep)

Minimal change in DM density

Use “P-GADGET” SPH

- Overcomes most standard SPH issues
- Feedback of **Hopkins**, Quartaert, and Murray (2012)

Jose Oñorbe

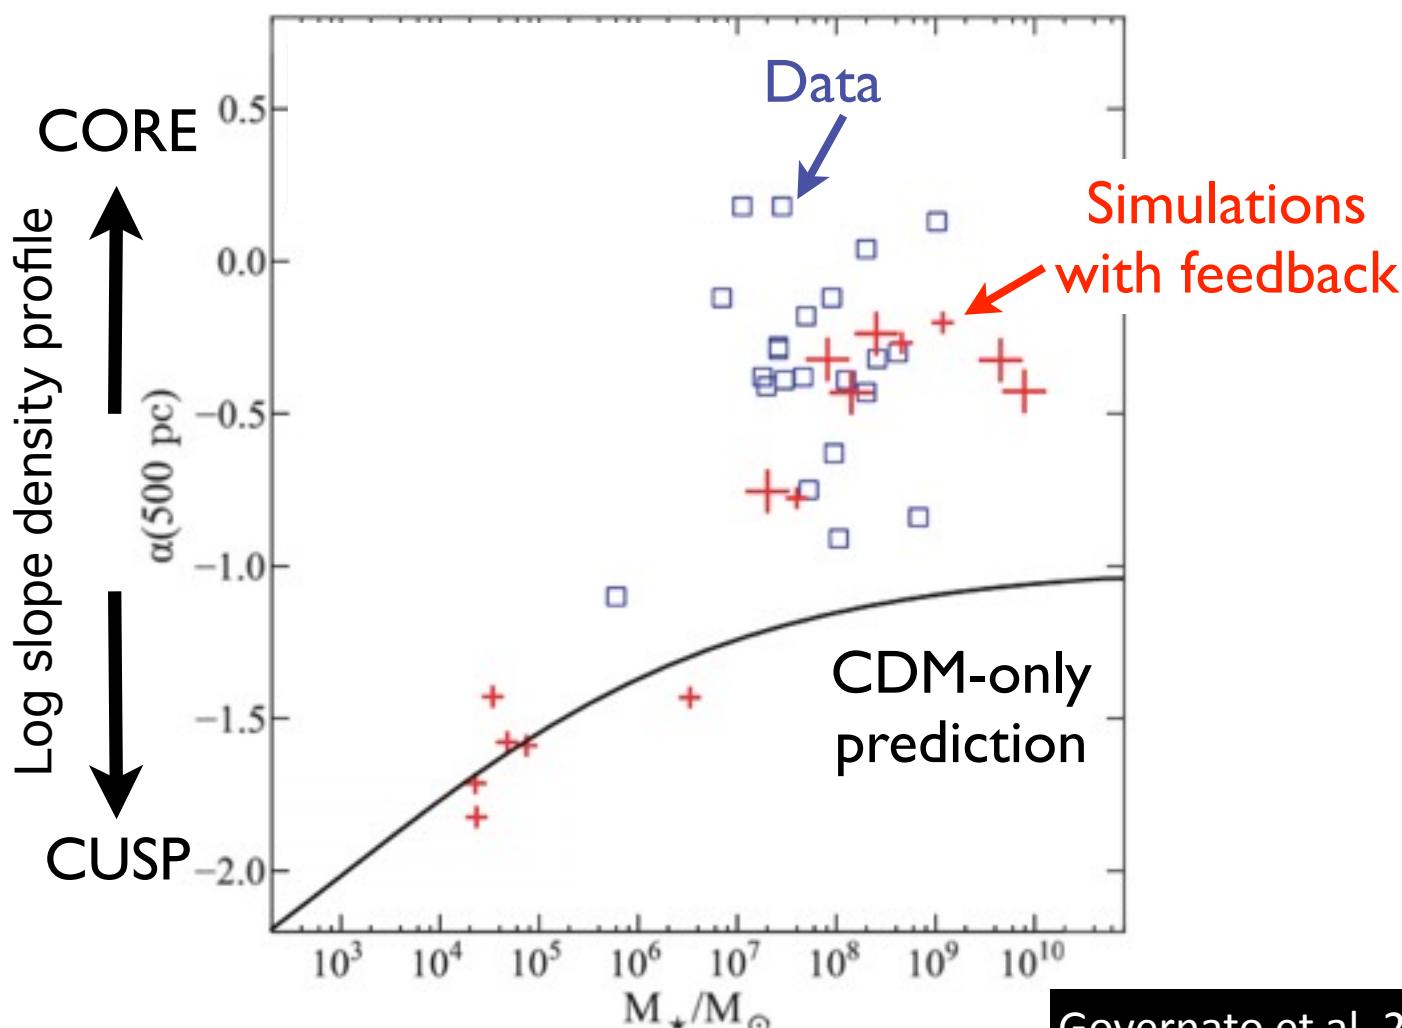

Z=0 Stats:

Abundance Matching [GOOD]
 $Fe/H \sim -2.5$ [GOOD]
 $M_{gas}/M_* \sim 0.1$ [OK]

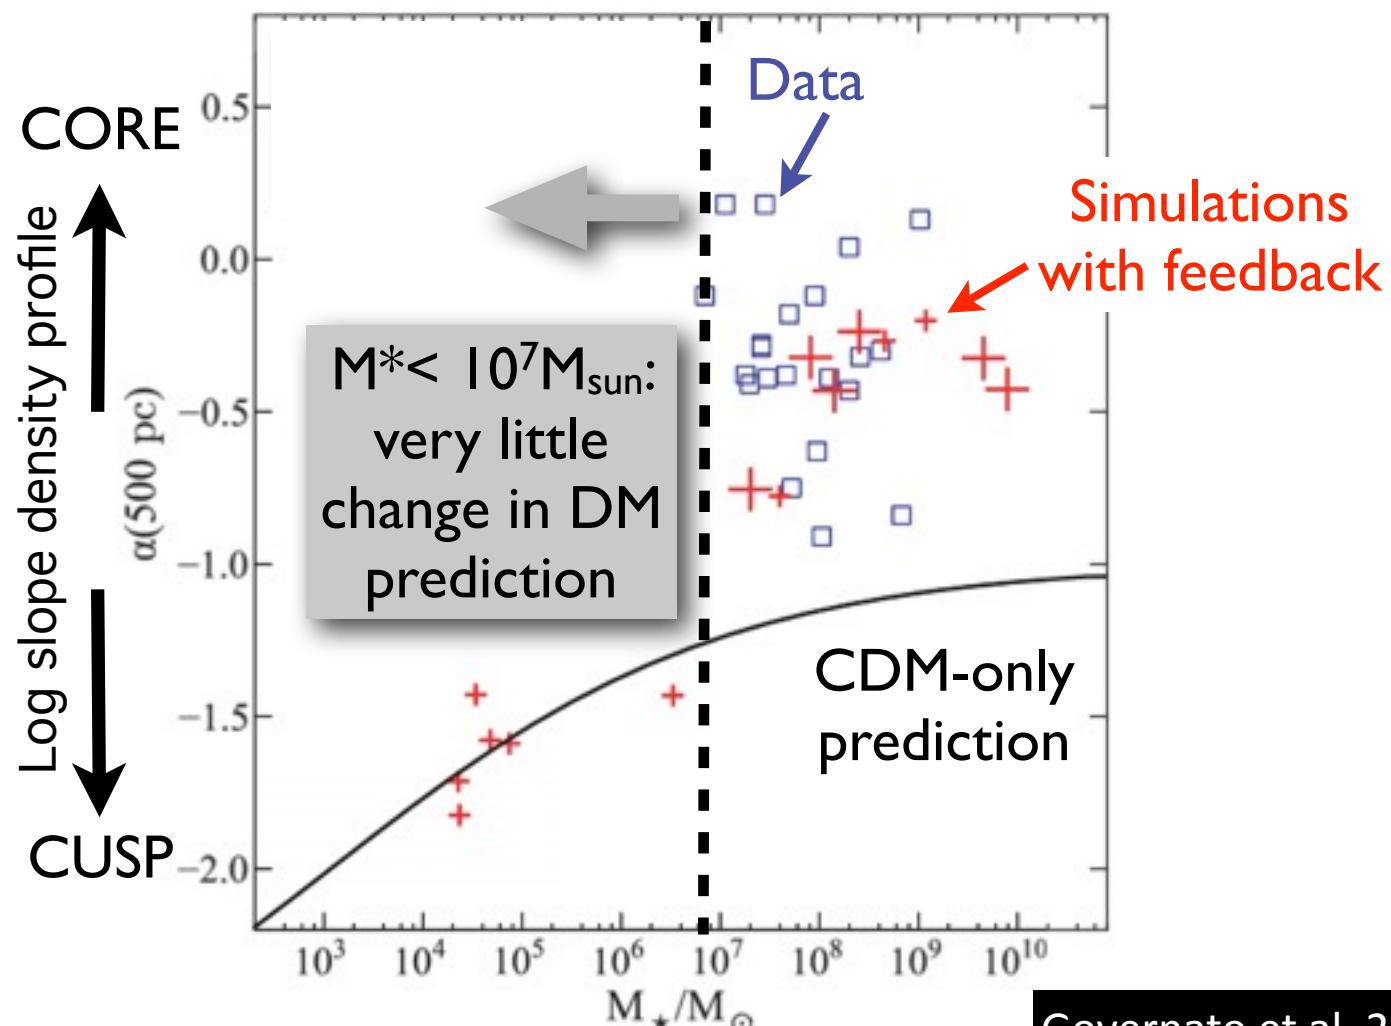

J. Bullock, UC Irvine

Baryonic Feedback: Not so effective for $M_* < 10^7$

J. Bullock, UC Irvine

Baryonic Feedback: Not so effective for $M_* < 10^7$

J. Bullock, UC Irvine

Is there a baryonic solution to Too Big to Fail?

SN Feedback alone: No

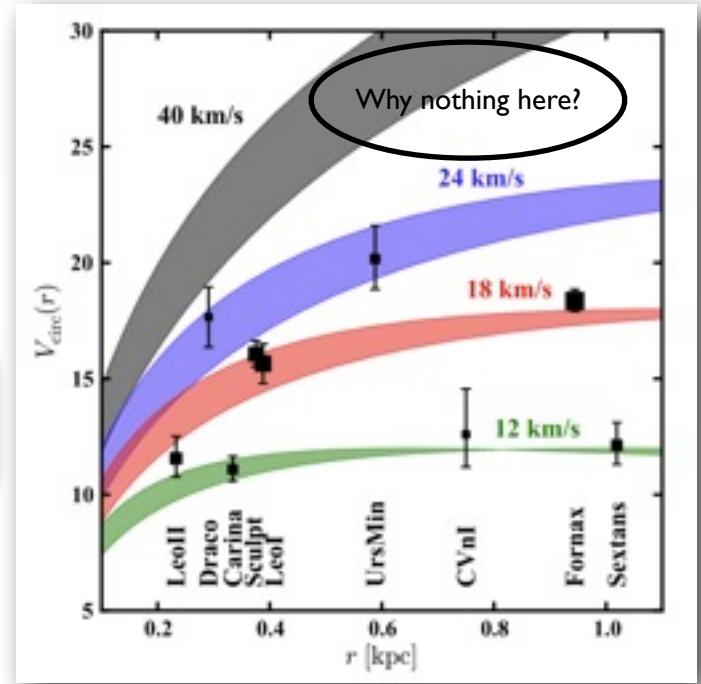

- **Not Enough Energy:** hard to affect densities with $< 10^6 M_{\text{sun}}$ of stars ($< 10^4 \text{ SN}$)

Garrison-Kimmel et al. 2013; Governato et al. 2012;
Penarrubia et al. 2012

Environment: best bet

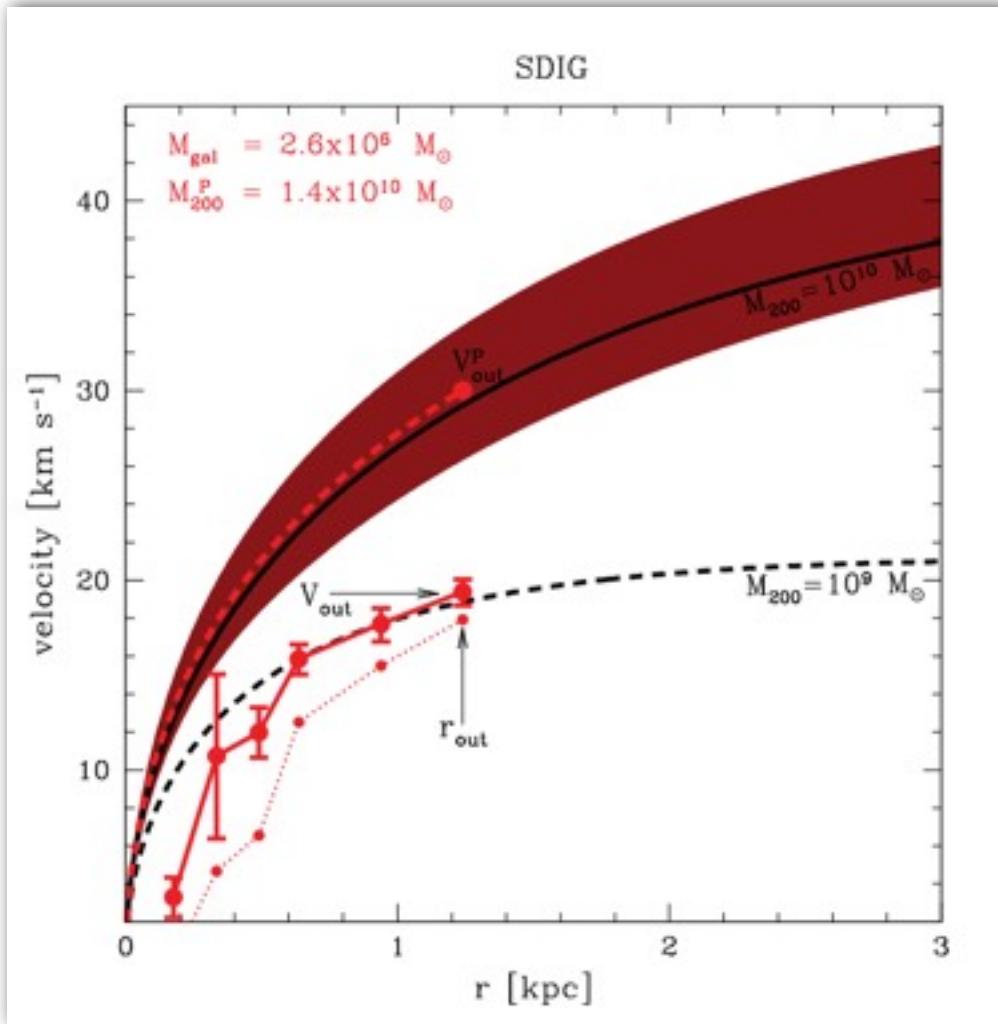

- Tidal forces (extra from disk) and ram-pressure stripping provide additional sources of energy to remove DM

Brooks & Zolotov 2012; Zolotov et al. 2012; Arraki et al. 2012

What's next?

Extend these studies to the field (no ram-pressure or tides)

Ferrero, Abadi, Navarro, Sales, &
Gurovich 2012

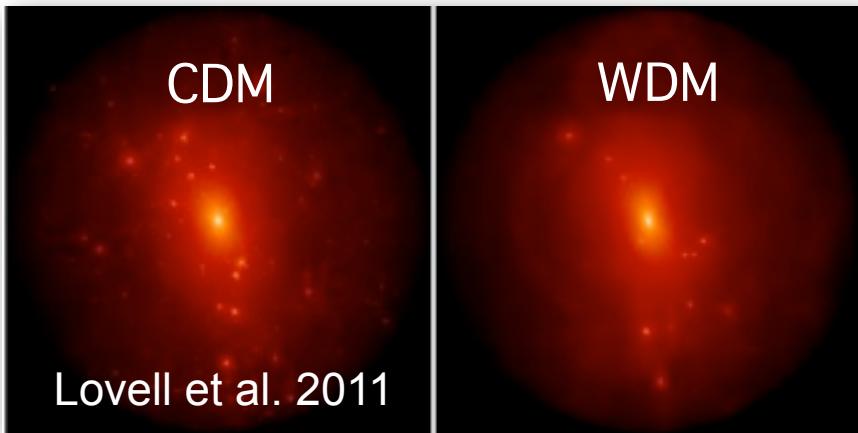

- Examine rotation curves of field dwarfs with $M_{\text{gal}} \sim 10^{6-7} M_{\odot}$
- **Same problem:** not dense enough
- Hard to reconcile with DM halo mass function + observed lum function

Abstract:

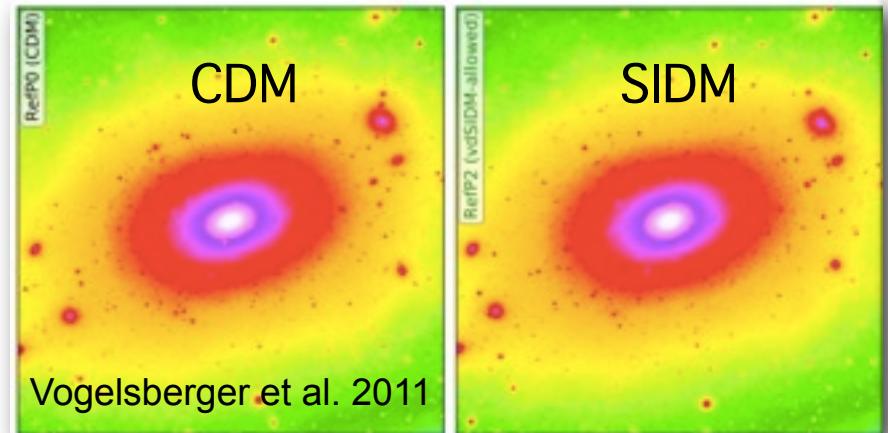

.... Resolving this challenge seems to require new insights into dwarf galaxy formation, or perhaps a radical revision of the prevailing paradigm.

Beyond Cold Dark Matter?

Warm Dark Matter:

Self-interacting Dark Matter:

$$m_{\text{dm}} \sim \text{keV}$$

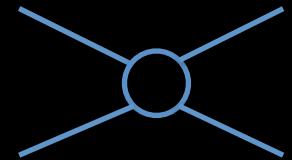

Lovell et al. 2011

$$\sigma/m_{\text{dm}} \sim 1 \text{ cm}^2/g$$

Vogelsberger et al. 2011, 2012;
Rocha et al. 2012; Peter et al. 2012;
Spergel & Steinhardt (2000)

J. Bullock, UC Irvine

Simulating Self-interacting DM

Scattering rate:

$$\Gamma = \rho_{\text{dm}} \left(\frac{\sigma}{m} \right) v_{\text{rms}}$$

For now: Elastic, Velocity Independent, Isotropic

Interesting things happen when $\Gamma \sim H_0$

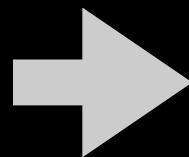

Miguel Rocha

Annika Peter

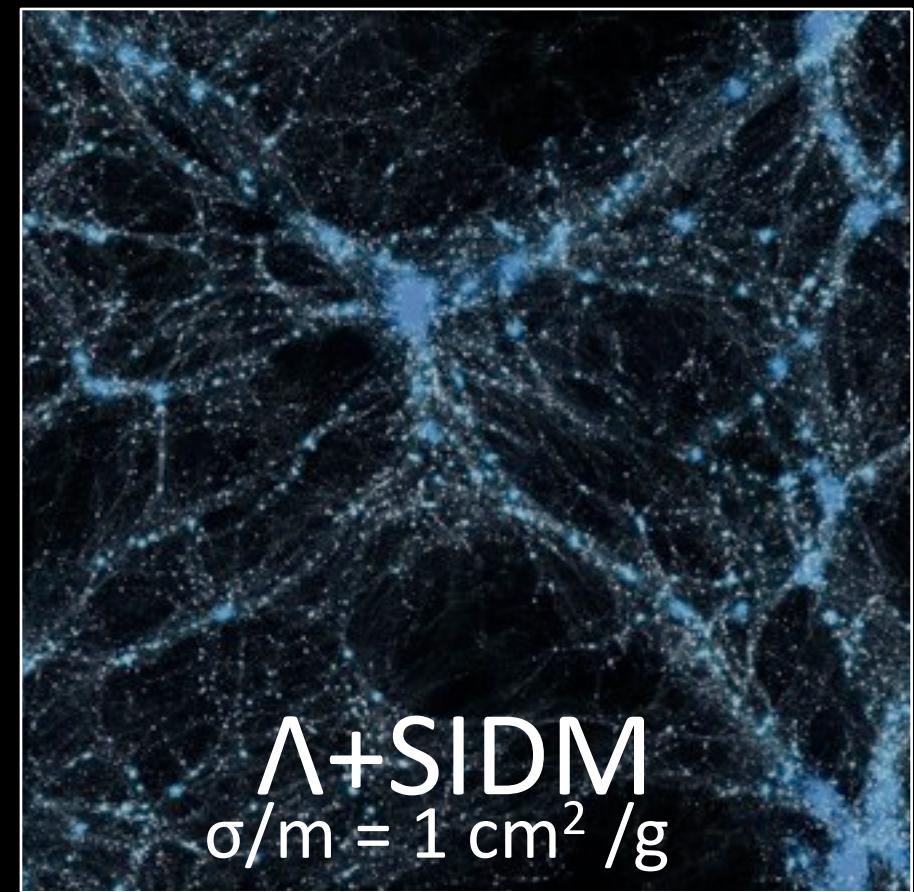

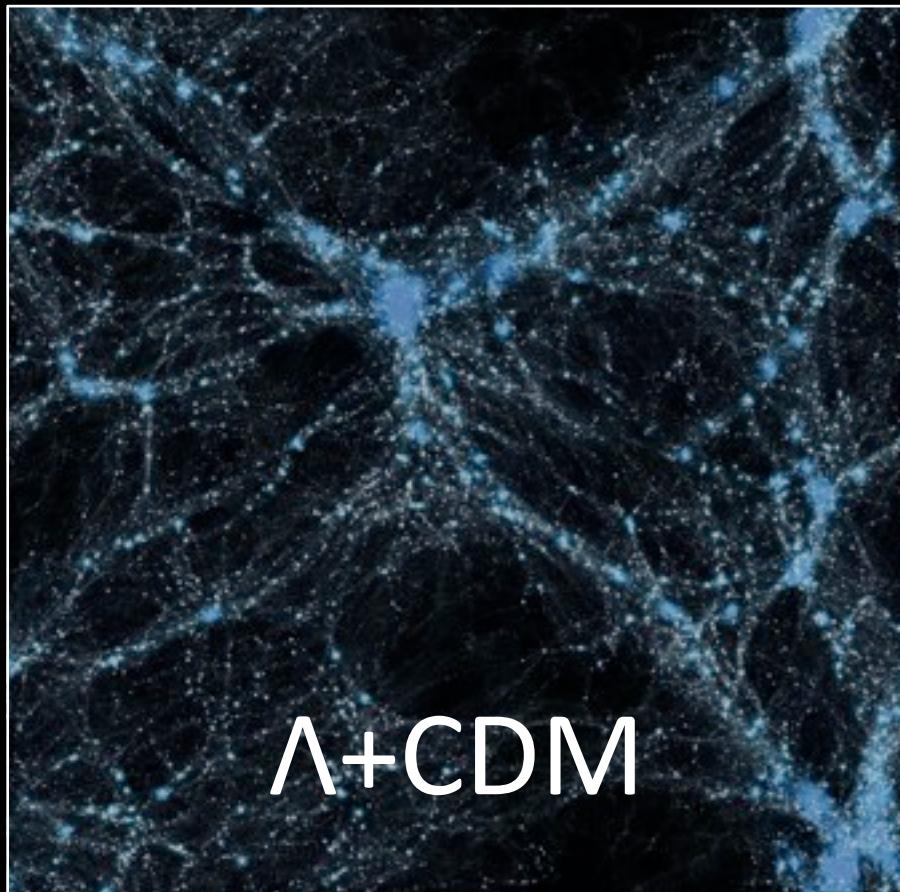

Manoj Kaplinghat

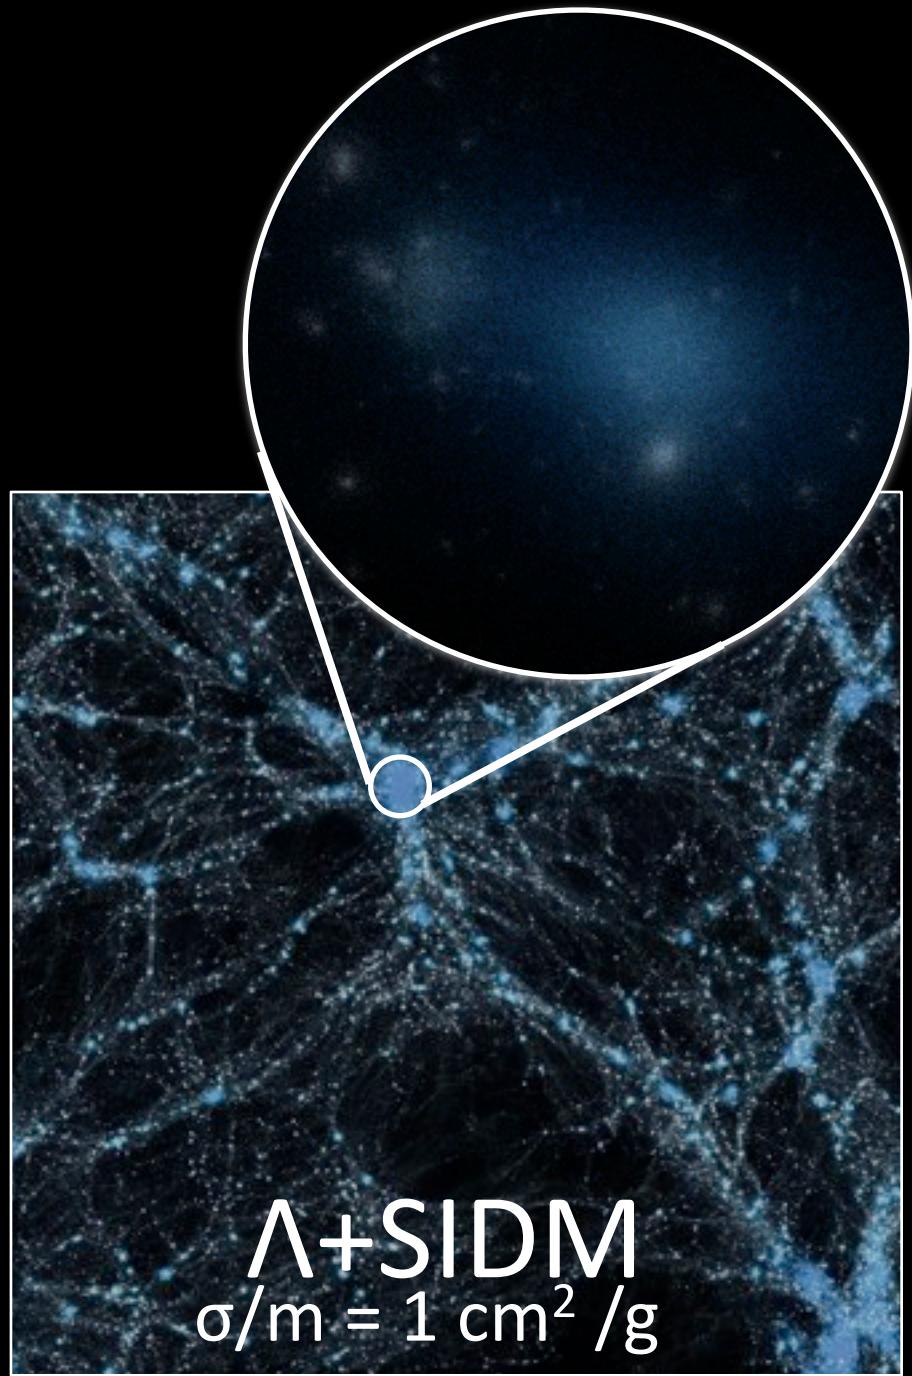

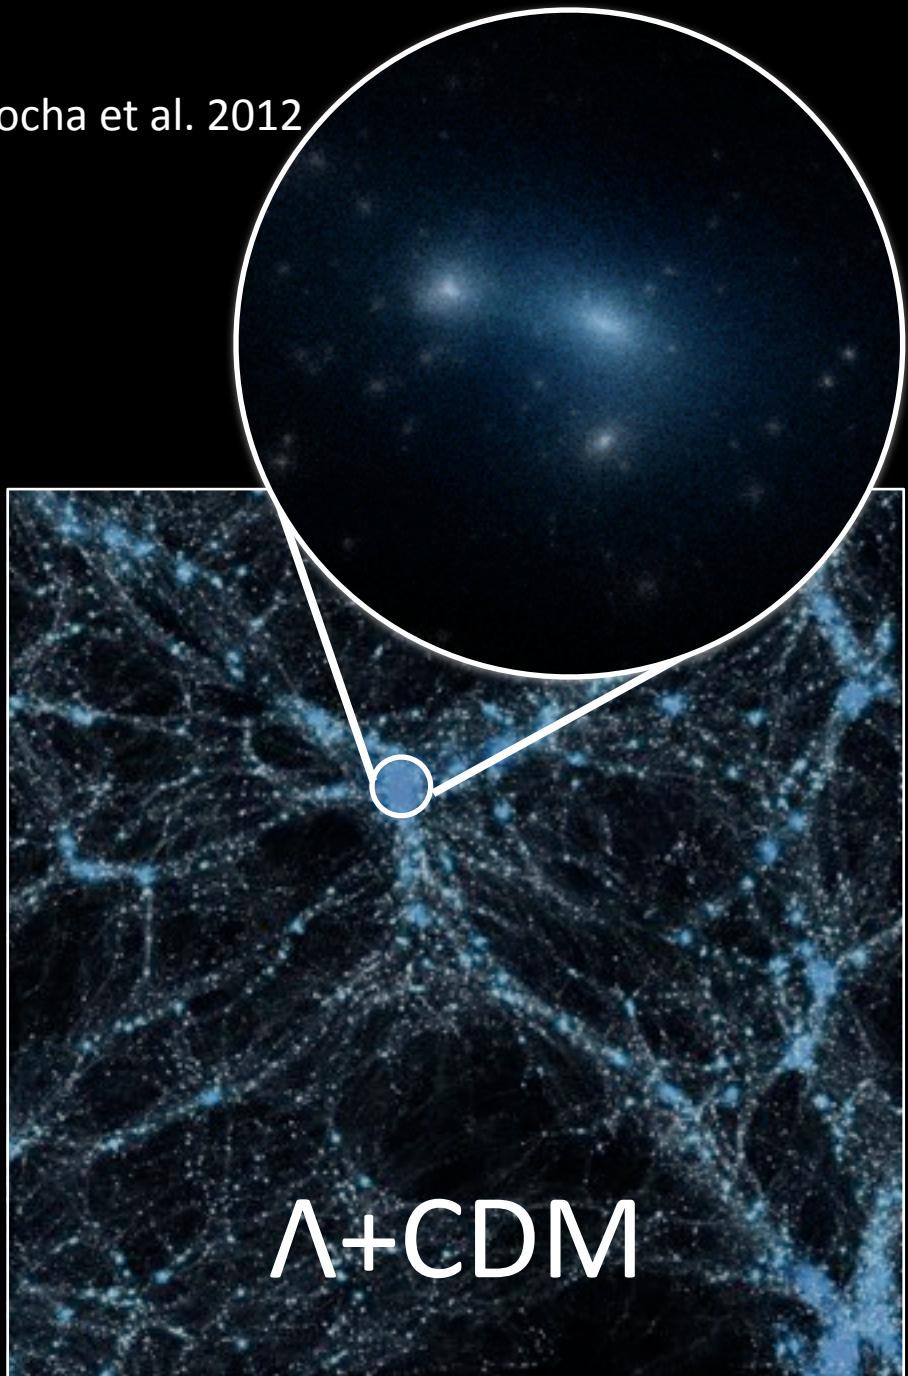

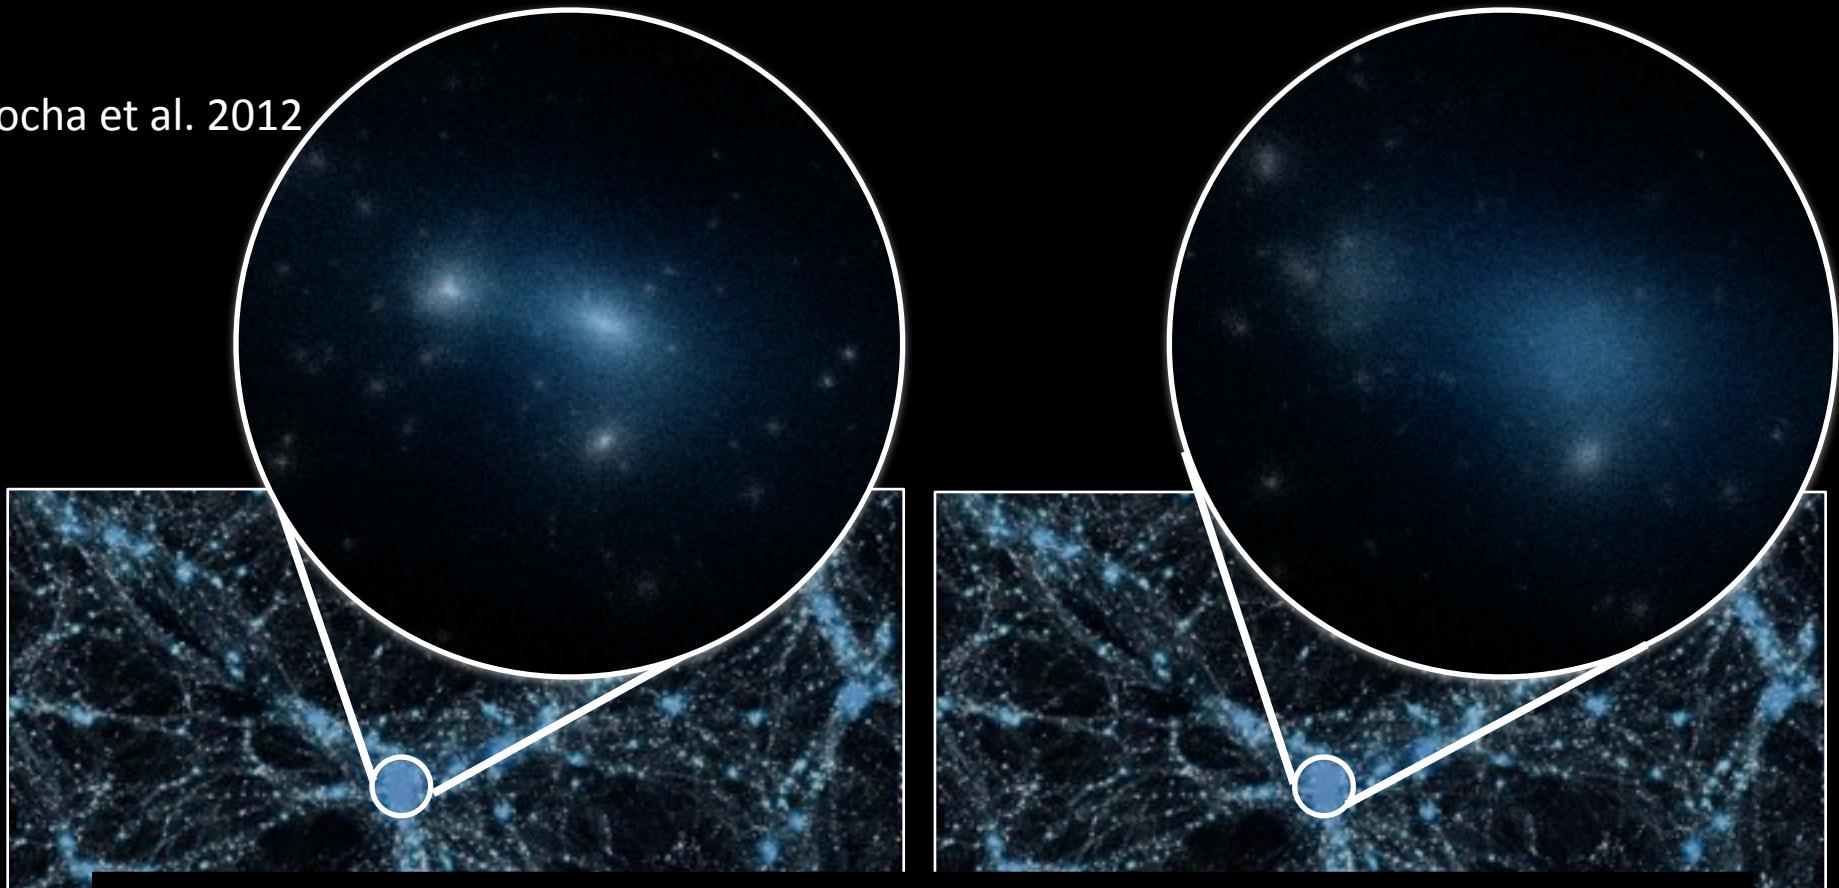

$$\frac{\sigma}{m} \sim 1 \text{ cm}^2/g$$

Identical large-scale structure

Rocha et al. 2012

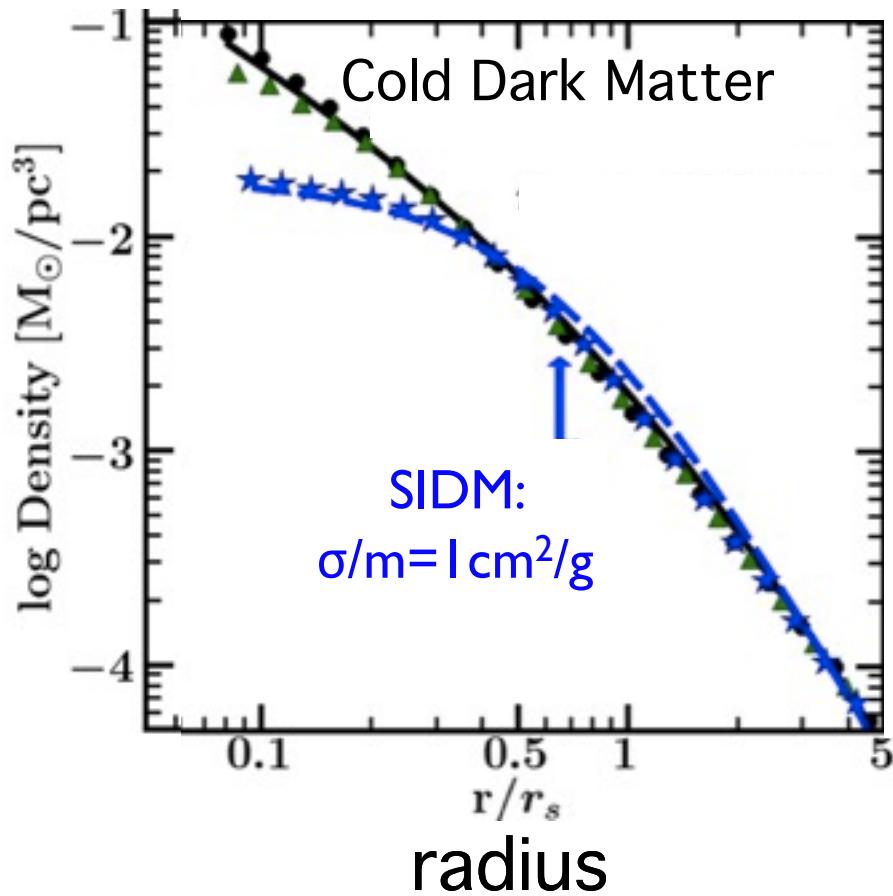

SIDM: Rounder, lower-density cores.
(substructure counts minimally affected)

Λ +CDM

Λ +SIDM
 $\sigma/m = 1 \text{ cm}^2/\text{g}$

SIDM Makes Cored Halos

Density

Take-Aways

I. The Too Big to Fail Problem

Satellites of MW have lower dark matter densities than expected.

- Where are the most massive/dense subhalos?

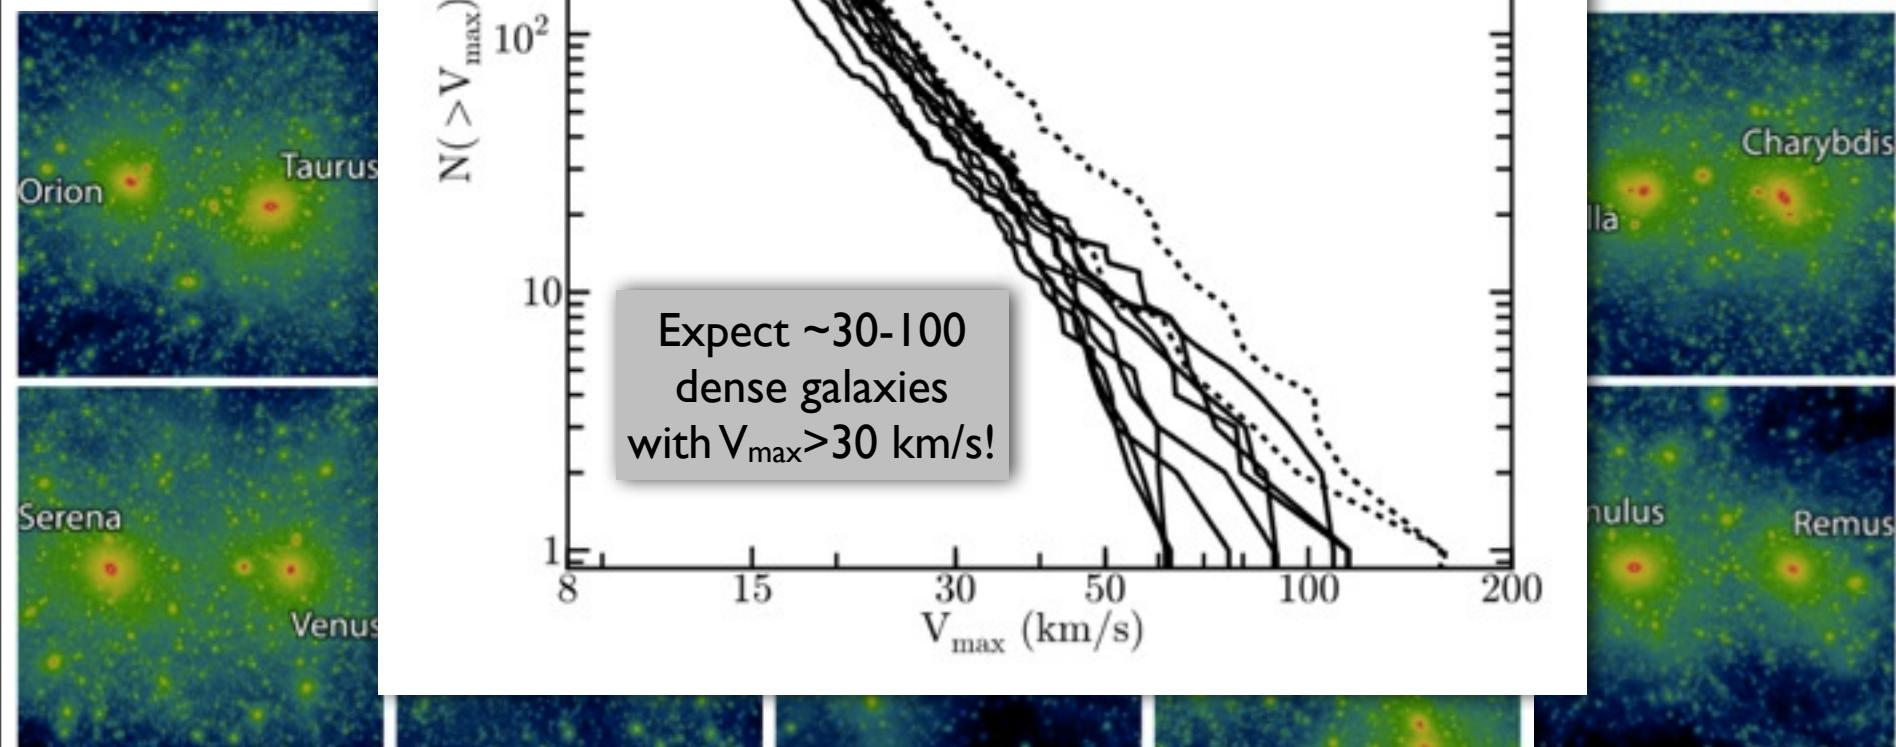

2. Possible solutions

- **SN Feedback?** Not enough stars to do it.
- **Any Baryonic process?** Could be environmental
 - test w/ obs of isolated dwarfs
- **Dark Matter physics?**
 - SIDM with $\sigma/m \sim 0.5\text{-}1 \text{ cm}^2/\text{g}$ can do it.

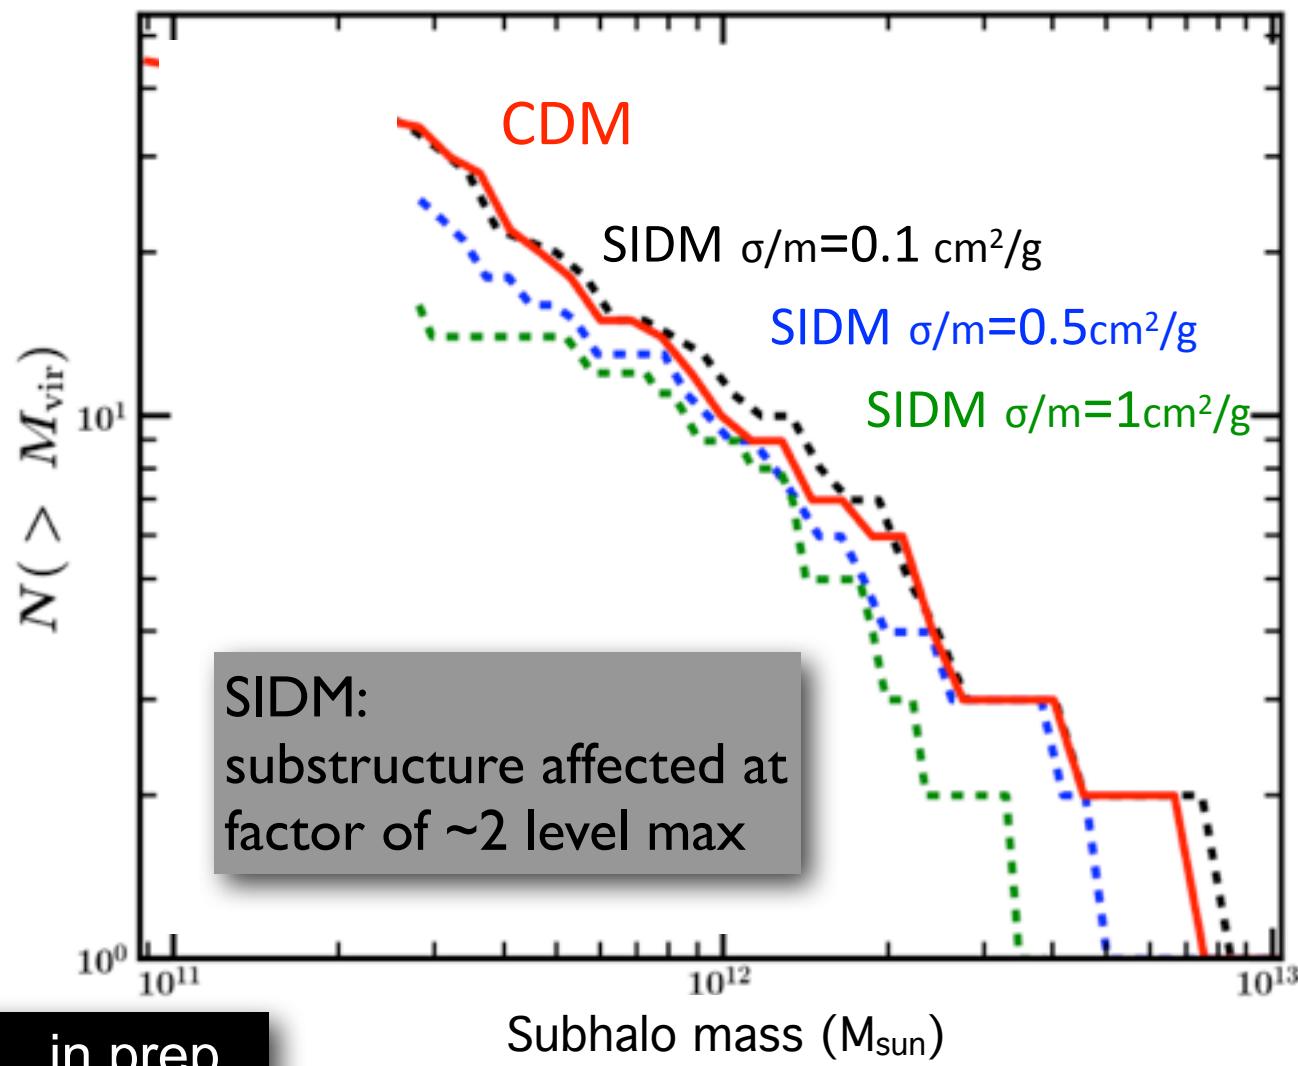

3. Where to look for DM weirdness?

Baryon-dominated systems are interesting in SIDM but HARD
Dark matter dominated dSph's in the "Local Field" may be the best bet.

The Local Volume Looks Problematic too

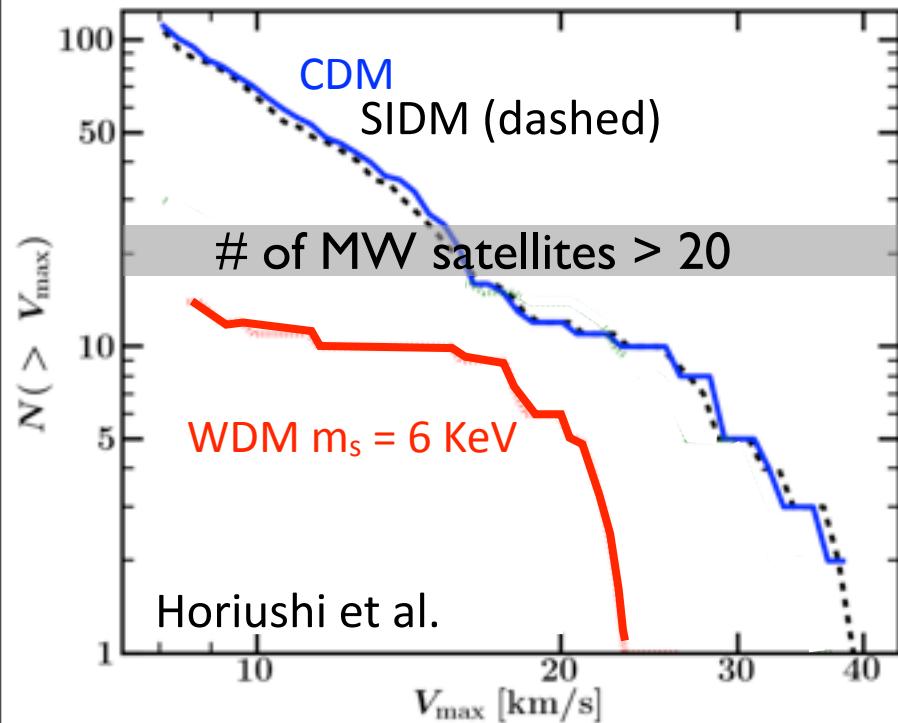

Massive Galaxy Cluster: $10^{15} M_{\text{sun}}$

Rocha et al., in prep.

J. Bullock, UC Irvine

Dark Matter Phenomenology: Substructure

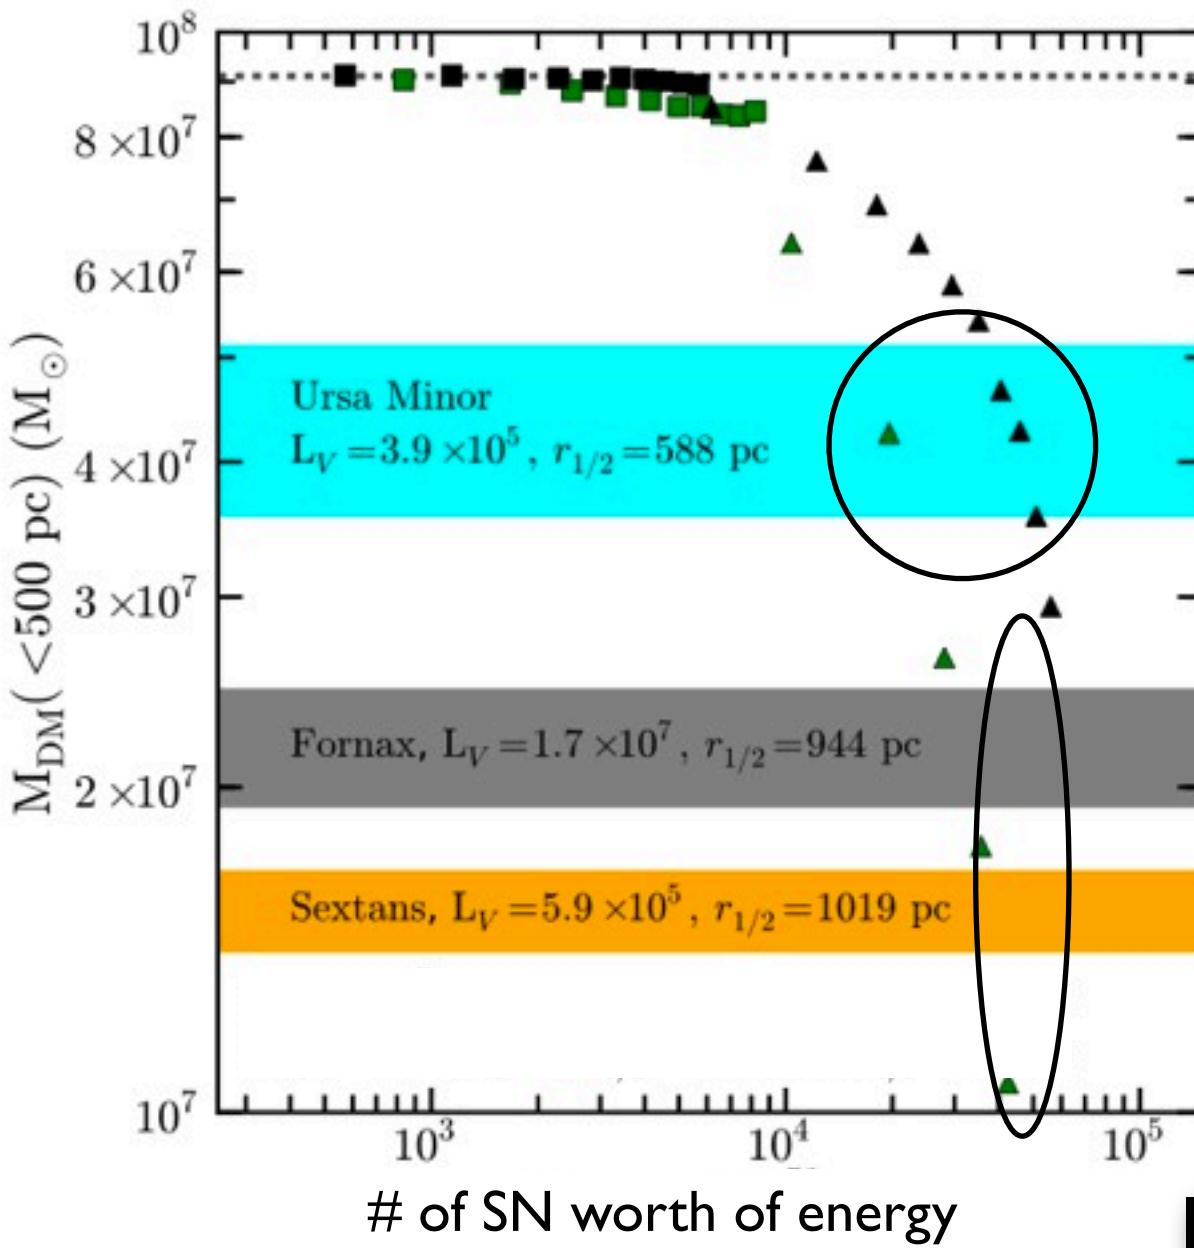

WDM:

- Solves Too Big To Fail by removing offending subhalos all together.

Problem:

- For models that solve the TBTF: *not enough subhalos to explain known satellite count*
 - Same models also struggle to explain Ly-alpha forest clumping

Expect:
0.01 Supernova per
solar mass of stars.

Req. more energy
than sum of all
supernovae in this
galaxy!

**Slightly more energy
input unbinds the
halo all together
(fine-tuning
problem)**

Garrison-Kimmel et al. 2013a
